For a complete preflight briefing

A preflight briefing is only **complete** when you have the latest **MET information and all current NOTAM**. NOTAM must include Head Office, FIR, airspace, departure, en route, destination and alternate locations. The GEN section of ERSA lists all AVFAX MET products.

Notes on using AVFAX

Briefing/QNH Areas are identified on Planning Chart Australia. FIRs are identified on En route Charts.

The Group codes shown on these pages give location, FIR, airspace NOTAM with the area and location MET and SIGMET within the area. Location NOTAM older than 7 days will appear as 1 line summaries.

To obtain more specific AVFAX information, refer to the GEN section of ERSA.

Groups of AVFAX product codes can be combined into single custom codes. If you fly the same route regularly, a single custom code can replace multiple standard codes. NAIPS Internet Service users can create and manage a custom code online using their NAIPS account. Alternatively, contact the AVFAX Help Desk 02 6268 5065^
Fax: 02 6268 5044, for assistance.

A faster method of keying product codes into AVFAX is to use the Fast Access Mode. This procedure is described in the GEN section of ERSA.

Cancelling an AVFAX request:

Your request will be cancelled if you hang up at any time before hearing the final "Thank You" response.

To update an AVFAX briefing

To receive an AVFAX update, use the NAIPS Internet Service or telephone a **Briefing Officer** on **1800 805 150**^. In each case you will need the Briefing Reference Number printed at the beginning of each AVFAX briefing. Updates from a Briefing Officer can be given over the phone or sent by Fax.

When Fax and phone are not available, call Flightwatch by HF radio, ask for an AVFAX update and quote the Briefing Reference Number.

AVFAX update is not readily available from ATC on VHF.

2. GEOGRAPHIC LOCATIONS

2.1 ARP Location is shown in degrees, minutes and seconds.

3. MAGNETIC VARIATION

3.1 Variation is shown in degrees magnetic, rounded to the nearest whole number.

4. TIME CONVERSION

4.1 As a combination of Local and UTC time is used throughout the ERSA, all published times have the designation Local or UTC.

4.2 Local time in Australia falls into three separate zones; Eastern Standard Time, which is UTC plus 10 hours (UTC + 10), Central Standard Time, which is UTC plus 9.5 hours (UTC + 9.30), and Western Standard Time, which is UTC plus 8 hours (UTC + 8).

4.3 These times apply as follows:

- a. EST is used in the states of New South Wales, (except the Broken Hill area), Queensland, Victoria, Tasmania and the Australian Capital Territory.
- b. CST is used in the state of South Australia, the Northern Territory and the Broken Hill area.
- c. WST is used in the State of Western Australia.

4.4 The time conversion shown at figure 4 represents the number of hours to be added to UTC to obtain the standard time applicable at that location. Allowance should therefore be made for any daylight saving that may be in force. (Note that 9.30 indicates nine and a half hours).

4.5 NOTAM will be issued detailing revised hours of operation for those aeronautical facilities affected by local time changes during periods of daylight saving and which do not have such hours promulgated in AIP.

9. SECURITY

- 9.1 An ASIC is a prerequisite for authorisation to have unescorted access to secure areas at security controlled airports, unless otherwise exempted under the Aviation Transport Security Regulations 2005. Airports that do not host scheduled air transport operations are exempt from ASIC requirements. The Department of Home Affairs (Home Affairs) maintains a list of security controlled airports which is available at www.homeaffairs.gov.au/about-us/our-portfolios/transport-security/air-cargo-and-aviation/aviation/airport-operators. Further information regarding ASICs can be found on the Home Affairs website: <https://www.homeaffairs.gov.au/about-us/our-portfolios/transport-security/identity>.

11. AERODROME OBSTACLE CHART TYPE A CHARTS

11.1 Aerodrome operators are responsible for Type A Chart information, (and the currency of this information), listed under aerodromes in FAC section. The Charts will be shown with an "Edition Number" and "Date"; e.g. RWY 12/30, Edition 6 - July 2002. The date shown is the date of the last survey.

12. RUNWAY DESIGNATION

12.1 RWY are normally numbered in relation to their magnetic direction rounded off to the nearest 10 degrees. Single runways are shown with the lower number on the left side. Parallel runways designated Left/Right are shown with the left runway listed first. Multiple runways are shown in ascending order from top to bottom.

13. RUNWAY BEARING

13.1 RWY bearing is in Degrees Magnetic.

14. RUNWAY DIMENSIONS

14.1 The RWY length is the physical length of the RWY (generally the higher of the two RWY direction TORA). RWY lengths are shown as multiples of 100 FT (e.g. lengths of 6,950 FT to 7,049 FT are shown as 70, lengths of 7,050 FT to 7,149 FT are shown as 71).

14.2 **SURFACE.** Runway surface is shown as follows:

- a or A asphalt or bitumen;
- b or B concrete;
- c or C other surfaces (always to be qualified by a note).

15. PAVEMENT STRENGTHS

15.1 The ICAO standard method of reporting pavement strength known as Aircraft Classification Number/Pavement Classification Number (ACN/PCN) has been incorporated.

Notes:

1. *Pavement strength data for Military aerodromes is tabulated in FIHA section AD 1.1.*
2. *Omission of pavement strength indicates that the RWY is unrated.*

16. PAVEMENT TYPE FOR ACN-PCN DETERMINATION

Pavement type	Code
Rigid pavement	R
Flexible pavement	F

17. PAVEMENT CONCESSIONS FOR ADF AERODROMES

17.1 Users requiring a pavement concession for a DOD AD are to contact the Civil Engineering Section of the Directorate of Estate Engineering Policy (EEP), within the Estate and Infrastructure Group (E&IG), on the following numbers:

Mobile	+61 405 228 962
Email	adf.ces@defence.gov.au

18. SUBGRADE STRENGTH CATEGORY

Subgrade strength category	Code
High strength	A
Medium strength	B
Low strength	C
Ultra low strength	D

19. MAXIMUM ALLOWABLE TYRE PRESSURE

19.1 Weight and tyre pressure limits are shown in KG and kPa (PSI) in the format 5700 450(65) and are gross limits, i.e. an ACFT may use that part of the movement area if the weight and tyre pressure are BLW the figures shown at the time of the operation. If the limitation is based on MTOW, this will be shown in the format MTOW 5700 KG, precluding an ACFT with MTOW in excess of the figure quoted FM OPR on the area specified.

- 19.2 Weight or tyre restrictions on RWY, TWY and aprons are shown in the remarks.
- 19.3 For aircraft less than or equal to 5,700KG maximum takeoff mass: report maximum allowable tyre pressure in kPa (PSI).
- 19.4 The actual numeric tyre pressure limit is published in kilopascal (kPa), rather than a category of limits. If the maximum allowable tyre pressure is unlimited and no pressure limits exists, the category code "W" will be published.

20. EVALUATION METHOD

Evaluation method

Technical evaluation: representing a specific study of the pavement characteristics and application of pavement behaviour technology

Using aircraft experience: representing a knowledge of the specific type and mass of aircraft satisfactorily being supported under regular use

21. RUNWAY SLOPE, RUNWAY STRIP WIDTH (RWS)

- 21.1 **SLOPE** on RWY quoted is the difference BTN the MAX and the MNM ELEV along the RCL divided by its length and expressed as a percentage to the nearest one-tenth of a percent. The "down" slope and its direction are tabulated in all cases, e.g., "0.8% down to SE". Where significant slope variations occur, additional data may be shown in notices, e.g. "E end level, centre section 0.5% down to W, W end 0.1% down to E".
- 21.2 **RWS**: is the width FM side to side which contains the RWY, the graded and ungraded portions of the RWS, shown in metres only. The GRADED portion of the RWS is defined by boundary markers and is graded to alleviate damage to an ACFT in the event that it runs off the RWY. The UNGRADED portion of the RWS is free of upstanding objects but may contain depressions, trenches, etc.

22. ARRESTING SYSTEMS

- 22.1 Systems, other than those detailed BLW, will be shown as A-Gear and amplified by a note.

a. Tensioned Hookcable Arresting Systems:

- (i) **BAK 12 HOOKCABLE AAS.**The BAK 12 AAS is a bi-directional Hookcable AAS. Energy is absorbed by a rotary friction braking system which is connected to the runway hookcable by a nylon tape. MAX tape runout is 365(1,200 FT). MAX energy absorption is 98.5 million FT LB. MNM rewind time is 3 minutes (nominal). Cycle rate for fighter type ACFT arrests is 12 ACFT per hour (nominal).
- (ii) **BAK 14.**The BAK 14 is a spring/pneumatic system used for raising and lowering an AAS hookcable from and into the runway. BAK 14 systems are installed, in conjunction with BAK 12 hookcables, at YSRI, YWLM, YAMB, YBTL, YPDN, YPED and YPTN and YPEA. Normally selected up at departure end for arrestable ACFT OPS. ACFT captains are to request "Cable Down" or alternatively request "Approach End Cable Up" if required.

CAUTION: In the event of power and or pneumatic failure, APCH/DEP end cable will rise to a height of 100MM (4IN) and remain until failure rectified.

b. **Aircraft Arresting Barriers**

- (i) **M34B/243 MEN.** Consists of two velocity-sensitive turbine-type rotary hydraulic (fluid turbulence producing) energy absorbers, one installed on each side of the runway, and a multi-element nylon (MEN) net suspended between retractable stanchions. It is a constant run-out, velocity-sensitive system that adjusts automatically to accommodate aircraft of different weights, engaging speeds and off-centre criteria. It has sufficient kinetic energy capacity to arrest jet type aircraft in the 10,000 to 20,000 Kg (22,048 to 44,094 pounds) weight range at speeds up to 180 knots. It is capable of safely stopping an aircraft, operating in the system's performance envelope, within a run-out distance of approximately 200 metres (656 feet), depending on system configuration. Engagements should be made as close to centre line as possible and not more than 10.6 metres (35 feet) from the centre line. Maximum engagement speeds (MES) are as follows:

Aircraft Weight	MES
10,000 KG	160 KT
15,000KG	160 KT
20,000 KG	135 KT

WARNING:

The Hawk 127 is not cleared for arrestor barrier engagement with 130 gallon external fuel tanks and/or AAR probe fitted.

Notes:

To ensure that the M34B brake cable payout does not occur until the net has deployed over the engaging ACFT, a shear pin is used to connect the net suspension cable to the brake cable at each side of the installation. These pins are intended to fail together shortly after engagement. If, however, the impact forces at engagement are low it is possible for only one pin to shear. This could result in the ACFT being yawed and subsequent damage being caused to it. Although the theoretical MNM engagement speed for both systems is zero KT, it is, for that reason, desirable to keep engagement speeds ABV 50KT for lightweight ACFT (BLW 60,000 LB) and 40KT for heavier ACFT. Suffix (R) indicates remote control from control tower available. Barriers are not to be used in winds above 35KTS except in the event of an EMERG.

c. **Flight Manuals.**

When RAAF Flight Manuals are amended, this paragraph will refer RAAF OPR to Flight Manuals for specific speed/weight configuration criteria for individual arresting systems. Other OPR should refer to their respective Flight Manuals.

d. **Arresting System Clearance Details.**

The following ACFT are cleared to use the respective arresting systems. (Safebar engagements are to be made with the canopy closed).

- (i) **M34B.** Hawk 127 (see warning ABV).

MAX weight speed limits vary from 10,000 LB/160KT to 25,000 LB/100KT to 100,000 LB/50KT.

Note 1. Safebar engagements must be made with the canopy closed.

Note 2. For M34B systems, the brake cable/brake drum attachment fitting is not designed to disengage itself when MAX payout has been reached. If brake tape payout is exceeded the system will lock and a considerable amount of tape stretch will occur, resulting in ACFT roll back up to 200 FT.

22.2 **BAK 12 Hookcable.**

- a. All hook equipped ACFT providing the weight and speed of the ACFT are within the parameters specified in the ACFT flight manual. For 1,200FT runout systems with synchronised pressure of 2,000 PSI at 780 RPM, general parameters are:
 - (i) Maximum engagement AUW is 95,000LB (43,180KG).
 - (ii) Maximum engagement speed at 95,000LB is 160KT.
 - (iii) Maximum engagement speed is 190KT.
 - (iv) Maximum AUW at 190 KT is 65,000LB (29,550KG).
 - (v) Minimum engagement AUW is 8,000LB(3,650KG)

b. **Trampling (Roll Over) Clearances BAK 12/14**

This section is under review.

Pilots should refer to the Pilot Operator Handbook or Flight Manual for specific restrictions for each ACFT. In the absence of any reference to trampling in either the Handbook or Manual, trampling is not authorised.

Note: Close formation trampling of the hookcable is not permitted. MNM time BTN successive ACFT trampling the hookcable is five seconds.

c. **Location of Arresting Systems**

- (i) The arresting systems are shown as located on the RWY. The middle portion of the RWY is indicated by a line and the distance of the arresting system from the end of the RWY (or into the overrun) on the end on which the system is located is indicated (in feet) in brackets under the applicable system. CAUTION: Up to 15 minutes notice may be RQ for rigging arresting gear for APCH end engagement.

RWY 15	M34B (R)	BAK 12/14 ----- (*1) 464 (1,521)	BAK 12/14 ----- (*1) 464 (1,521)	M34B (R)	RWY 33

*1. Hookcable normally rigged across DEP end of RWY for arrestable ACFT OPS.

*2. Suffix (R) indicates remote control from control Tower available.

*3. Suffix (B) indicates the arresting systems allows bi directional engagement.

SALS	Simple Approach Lighting System
SDBY PWR	Standby Power
SFL	Sequenced Flashing Lights
STWL	Stopway Light(s)
T -VASIS	T pattern Visual Approach Slope Indicator System

23.2 **Lights may be described by the following abbreviations:**

ALTN	Alternating
B	Blue
FLG	Flashing
G	Green
GP FLG (number)	Group flashing (number)
OCC	Occulting
R	Red
W	White
Y	Yellow

23.3 Lighting provided by kerosene lamps may not be available during fire ban periods, except in emergencies.

23.4 **Pilot Activated Lighting (PAL)**

a. Lighting is actuated with a transmission sequence on the published frequency.

Activation	Transmission Sequence	Activation transmission
PAL	3 bursts of between 1 and 5 seconds within 25 seconds	
PAL + AA (audio acknowledgement)	3 bursts of 1 second each within 5 seconds	
AFRU + PAL	3 bursts of 1 second each within 5 seconds	

b. Non-standard activation sequences and audio acknowledgement responses on PAL frequencies are published for applicable aerodromes in ERSA FAC.

23.5. T-VASIS/AT-VASIS

- a. The T-VASIS consists of twenty light units symmetrically disposed about the RWY centre line in the form of two wing bars of four light units each, with bisecting longitudinal lines of six lights.
- b. The AT-VASIS consists of ten light units arranged on one side of the RWY in the form of a single wing bar of four light units with a bisecting longitudinal line of six lights.
- c. The crossbar represents 'on glide-slope' and deviations appear as one, two or three lights ABV or BLW the crossbar. The sensitivity is similar to flying within the 'three-dot-up' or 'three-dot-down' positions of an ILS glide path.
- d. The T-VASIS is designed so that with only the crossbar lights visible, the glide-slope is 3DEG and the pilot's eye-height over the THR is APPROX 47 FT. The height quoted in FT is the MNM EYE HEIGHT at THR, i.e. the lowest height at which an "on glide path" indication will be seen. If increased eye-height over the THR is required (e.g. long/wide bodied ACFT) this can be achieved by flying the approach with the crossbar and one or more of the 'fly-down' lights visible as required. In this manner variable vertical distances between the pilot's eyes and the THR can be obtained.
- e. **APPROACH SLOPE INDICATION EYE HEIGHT ABOVE THRESHOLD**

THREE LIGHTS FLY UP	Ground level to 7FT
TWO LIGHTS FLY UP	8FT to 25FT
ONE LIGHT FLY UP	25FT to 41FT
ON GLIDE SLOPE	49FT
ONE LIGHT FLY DOWN	57FT to 75FT
TWO LIGHTS FLY DOWN	75FT to 94FT
THREE LIGHTS FLY DOWN	94FT to 176FT

The previous dimensions may vary by 15 FT, depending on the location of the system as dictated by siting requirements.

- 23.6 The initial intensity of the system is determined by ATS, but may be varied at the request of the pilot.

23.7. PAPI

- a. The PAPI system consists of a wing bar of 4 (or paired single lamp) lights equally spaced located on the left side of the RWY unless it is physically impracticable to do so.
- b. The height quoted in FT is the MNM EYE HEIGHT at THR, i.e. the lowest height at which an "on glide path" indication will be seen.
- c. The wing bar of a PAPI is arranged in such a manner that a pilot making an APCH will:
 - (i) when on or close to the APCH slope, see the two units nearest the RWY as red and the two units farthest from the RWY as white;
 - (ii) when ABV the approach slope, see the one unit nearest the RWY as red and the three units farthest from the RWY as white; and when further above the APCH slope, see all the units as white; and
 - (iii) when BLW the APCH slope, see the three units nearest the RWY as red and the unit farthest from the RWY as white; and when further BLW the APCH slope, see all the units as red.

24. RADIO NAVIGATION AND LANDING AIDS**24.1. Distance Measuring Equipment**

- a. The DME system uses the channels designated in *ICAO Annex 10* for operation with the VOR FREQ selected for the same AD. This "pairing" of the VOR and the DME thus permits airborne equipment suitably designed, to display both DME and VOR INFO by the selection of only the VOR FREQ.
- b. TACAN has also been installed at a number of MIL and joint user AD and the DME element of these installations is AVBL to civil ACFT equipped with 1000 DME. This element will normally be paired with VOR where both facilities are established at a joint user AD/WI the *ICAO Annex 10 collocation DIST RQMNTS*.

- c. The availability of associated VOR and DME INFO is shown in ERSA, ERC, AC and on FLIP Terminal charts in one of the FLW forms.

VOR/DME	112.7
VOR	113.7
DME	112.7/74X
TACAN	84

24.2. Bearings, Distance and Hours of Aids

Bearings and distance given is from the aid to the ARP, (shown in DEG MAG and NM) unless noted that the bearing and distance is to the appropriate RWY THR. Navigation aids HR of OPS H24 unless otherwise shown.

24.3. Hazard Beacons (HBO)

Hazard Beacons are utilised as an aid to navigation for obstacle avoidance in the vicinity of aerodromes. HBO are either HIOL or MIOL (*see Aerodrome and Approach Lighting*).

25. COMMON TRAFFIC ADVISORY FREQUENCY (CTAF)

25.1 Frequencies to be used for operations at aerodromes are listed against locations under the heading "CTAF".

25.2 Carriage of serviceable VHF radio, and being qualified to use it, is mandatory when operating at, or in the vicinity of, all non-controlled certified and military aerodromes. However, a pilot may operate an aircraft with an unserviceable VHF radio at, or in the vicinity of, an uncontrolled aerodrome where the carriage of serviceable VHF radio is normally required if a radio failure occurs during the flight or if the purpose of the flight is to take the radio to a place where it can be repaired. The pilot may continue to land at the aerodrome provided the pilot activates the aircraft's anti-collision lights, landing lights and transponder (if any) whilst within the vicinity of the aerodrome and, if arriving at the aerodrome, joins the circuit on the crosswind leg.

Note: A pilot should avoid planning to arrive at or depart from an aerodrome for radio repairs during the known hours of scheduled air transport operations. For aerodromes where there is a UNICOM or CA/GRS, pilots should, by alternative means, where possible, make contact and advise intentions before conducting operations.

25.3 A pilot may operate an aircraft that is not equipped with a serviceable aircraft VHF radio, or which is equipped with such a radio but which the pilot is not qualified to use, to or from an uncontrolled aerodrome at which the carriage of radio is normally required if the aircraft is flown:

- a. In VMC by day, and
- b. Arrives or departs in company with another aircraft which is radio-equipped and flown by a radio-qualified pilot which will allow the latter to make radio calls on behalf of both aircraft. The radio equipped aircraft should be manoeuvred to keep the no radio aircraft at a safe distance and in sight at all times in order to accurately report its position.

25.4 Pilots of inbound traffic should monitor and communicate as appropriate on the designated CTAF from 10 miles to landing. Pilots of departing aircraft should monitor/communicate on the appropriate frequency from start-up, during taxi, and until 10 miles from the airport unless local procedures require otherwise.

25.5 Pilots of aircraft conducting other than arriving or departing operations at altitudes normally used by arriving and departing aircraft should monitor/communicate on the appropriate frequency while within 10 miles of the airport unless required to do otherwise by local procedures. Such operations include parachute jumping/dropping, en route, practicing manoeuvres, etc.

26. AERODROME FREQUENCY RESPONSE UNIT (AFRU)

- 26.1 An aerodrome frequency response unit will provide an automatic response when pilots transmit on the traffic frequency for the particular aerodrome, normally the CTAF. It will assist in indicating inadvertent selection of the incorrect VHF frequency when pilots operate into uncontrolled aerodromes.
- 26.2 At locations where an AFRU is installed, the entry “AFRU” is included in the CTAF heading.
- 26.3 When an ACFT operating within approximately 20 to 30 NM of the AFRU makes a transmission of 2 secs duration or more on the aerodrome FREQ, the AFRU will automatically respond with one of the following types of transmissions:
- If no other ACFT transmissions have been received within the previous 5 minutes, a pre-recorded voice message comprising aerodrome identification followed by “CTAF”; or
 - If any ACFT transmissions have been received within the previous 5 minutes, a low volume 300 millisecond tone burst.
- 26.4 The AFRU will also detect ACFT transmissions which consist of three sequential carrier bursts within a five second period (i.e. three microphone clicks) and respond with the prerecorded voice message, regardless of aircraft radio transmission activity in the last 5 minutes. Further information can be found in *AIP Book*.

27. ATS COMMUNICATIONS FACILITIES

This section contains detailed information regarding the type, call sign, frequency, hours of operation and other notes regarding the communication facilities available at an aerodrome.

27.1 Certified Air/Ground Radio Service (CA/GRS)

A CA/GRS is an aerodrome radio information service on the CTAF. The service is an information service, not an air traffic service. Pilots retain full responsibility to decide whether to accept and use the information provided. A CA/GRS provides the following information:

- Confirmation of frequency selection by pilots, by means of the operator's response to a pilot's broadcast when taxiing at an aerodrome or inbound to an aerodrome.
- Known, relevant traffic on the CTAF and on the manoeuvring area of the aerodrome to an aircraft when taxiing for departure or inbound to an aerodrome.
- Weather conditions at the aerodrome. The weather information which may be advised is runway favoured by wind or for noise abatement, runway surface conditions, wind direction and speed, visibility and present weather, estimated cloud base, surface temperature, and aerodrome QNH. This information will be provided by means of an Automatic Aerodrome Information Service (AAIS) broadcast on a discrete frequency (similar to ATIS) during CA/GRS OPR HR or on request to the CA/GRS. QNH provided by a CA/GRS or AAIS may be used to reduce DAP IAL MDA in accordance with *AIP ENR 1.5, QNH Sources*.
- Other local information.
- Emergency services call-out, if requested by the pilot in an emergency.

At those aerodromes where a Certified Air/Ground Radio Service is provided, the abbreviation “CA/GRS” is included in the aerodrome entry, together with the designated broadcast area and frequency, the AAIS frequency and any location specific procedures, service's hours of operation and callsign.

27.2 UNICOM

UNICOM (Universal Communications) is a service provided on specific frequencies to enhance the value of information normally available about a non controlled aerodrome. UNICOM is not provided by Airservices Australia.

At locations where a UNICOM has been established, the entry giving details about the service, such as the callsign, hours of operation or any particular service provided, will be shown in ATS COMMUNICATION FACILITIES.

UNICOM operators are required to obtain a licence from The Australian Communications Authority and frequency band approval must come from Airservices Australia, prior to the entry being placed in this document.

28. HANDLING SERVICES AND FACILITIES

28.1 Replenishment facilities are listed using the following codes. The left hand column contains the code symbol, the main body gives a brief description and where applicable, finally (in brackets) the Australian designation.

CAUTION: Due to changes without notice, accuracy of REPLEN entries under “Ground Services”, cannot be guaranteed.

When information is received from the relevant aerodrome authority, a NOTAM will be issued notifying changes to refuelling information. However, Airservices Australia takes no responsibility for the accuracy or completeness of refuelling information.

30. RESCUE AND FIREFIGHTING SERVICES

30.1 RFFS FACILITIES are allocated a CAT within the range of CAT 1 to CAT 10 with minimum water quantity and RFFS vehicle requirements as per the table. Note that the figures below refer to quantities and discharge rates for water and different minimum quantities and discharge rates apply to other extinguishing agents. Categories are allocated to give a reasonable chance of rescue at a serious accident, with the probability of survivors, involving an ACFT within the group. Military users refer DI(AF)OPS for specific requirements/conditions applicable to Military airfields.

CAT	1	2	3	4	5	6	7	8	9	10
MNM water quantity RQ	230	670	1200	2400	5400	7900	12100	18200	24300	32300

30.2. Aircservices RFFS - ICAO/CASA Standard

30.2.1 This chart indicates the (ICAO) "minimum" useable amounts of extinguishing agents applicable to each RFFS category.

Category	Vehicle	Water	Discharge Rate	Complementary Agent (Dry Chemical)
5	1	5400	3000 l/m	180KG
6	2	7900	4000 l/m	225KG
7	2	12100	5300 l/m	225KG
8	3	18200	7200 l/m	450KG
9	3	24300	9000 l/m	450KG

30.3. Airservices Water Rescue Service (WRS)

- a. Airservices Australia RFFS provides a water rescue service at certain aerodromes as specified in the relevant aerodrome's RFFS entry in ERSA. This service consists of rescue boats which provide a first response to an ACFT incident in water areas to deploy flotation platforms, pending the arrival of a larger, second stage response under an aerodrome AEP.
- b. The water rescue service does not constitute a part of RFFS category however, any subsequent non availability of the complete WRS will generate notification processes compatible with a contingency plan involving other emergency Agencies (and ATS) at that aerodrome location.

31. PASSENGER FACILITIES

31.1 The following codes are used for the display of PUBFAC data in ERSA:

AC	ACCOMMODATION	PT	PUBLIC TELEPHONE
BU	BUS TO TOWN	RF	REFRESHMENT
HC	HIRE CAR	WC	TOILETS
LG	PASSENGER LOUNGE	TX	TAXI
ME	MAINTENANCE		

31.2 Where relevant and available other brief information, e.g. telephone numbers, is included alongside the facility.

31.3 In many instances services such as taxi or hire car are not available at the aerodrome itself, but need to be contacted by telephone after arrival. Where availability of refreshments is indicated there is usually some limitation on the hours, and may vary from full meal service to a drink vending machine. Buses are often scheduled to meet scheduled air transport operation aircraft only. **AIRSERVICES ACCEPTS NO RESPONSIBILITY FOR THE ACCURACY OF PUBFAC DATA.**

32. WAC CHART REFERENCE

32.1 The WAC Chart on which the AD can be found.

33. CHANGES IN AERODROME INFORMATION

33.1 Changes in AD INFO will be promulgated by NOTAM to the extent indicated BLW:

- a. Co-ordinates/LCA of the AD - if the PSN is altered by more than 0.5 NM;
- b. ELEV of an AD - alterations in excess of:
 - (i) 20FT for AD with instrument approaches
 - (ii) 100FT for other AD;
- c. RWY/Strip bearing and number - alterations which cause a change in RWY number; and
- d. Declared Distances, Supplementary TKOF Distances and Dimensions of RWY and RWS -
 - (i) length - 10(33FT) decrease or 30(98FT) increase.
 - (ii) width - any change.
- e. TODA Gradient - any change in gradient in excess of 0.05%.

33.2 NOTAM advising of reductions in RWY length due to obstacles associated with WIP will include the LCA of the obstacle(s). Some NOTAM may include additional obstacle information intended solely to amend the obstruction chart issued for that AD.

- a. The work is on the movement area, and/or
- b. Obstacles infringe clearance surfaces, and the affected area cannot be restored within 10 MIN of an ACFT's indicated intention to use the area.

Although maintenance staff are RQ to watch for ACFT, pilots OPR into non-controlled AD may need to attract the attention of such staff before LDG or TKOF.

1. DECLARED DISTANCES

1.1 Declared distances in metres(feet) are tabulated for each RWY. They are:

a. **TORA (TAKEOFF RUN AVAILABLE)**

The length of RWY declared available and suitable for the ground run of an ACFT taking off. (In most cases, this corresponds to the physical length of the RWY pavement.)

b. **TODA (TAKEOFF DISTANCE AVAILABLE)**

The length of TKOF run available plus the length of any clearway (CWY) available.

c. **ASDA (ACCELERATE-STOP DISTANCE AVAILABLE)**

The length of TKOF run available, plus the length of the stopway (SWY), if provided. (Any SWY length included shall be adequate for use by all ACFT which comply with the RWY strength rating.)

d. **LDA (LANDING DISTANCE AVAILABLE)**

The length of RWY declared available and suitable for the ground run of an ACFT landing (LDG). (In most cases, this corresponds to the physical length of the RWY pavement.)

1.2. Runway End Safety Area (RESA)

1.2.1 RESA is the maintained area at the end of the runway strip that protects an aeroplane from hazards if it undershoots or overruns the runway. RESA is not required for Code 1 and 2 non-instrument runways.

Note: Prior to 2004, RESA were able to commence from the end of the runway, or stopway, if provided. It will be specified in the AIP from where the RESA starts.

1.3. Aerodrome Reference Code - Code Number (CN)

1.3.1 A reference code number is provided for each RWY listed in the RDS (in brackets after each RWY designation number). This code number indicates the maximum field length of the aeroplane that the RWY is designed for. Code numbers and associated field lengths are as follows:

1 - Field length of less than 800M

2 - Field length of 800M up to, but not including, 1200M

3 - Field length of 1200M up to but not including 1800M.

4 - Field length of 1800M and over.

1.3.2 Pilots should note that the field length of an aeroplane is based on the performance of an aeroplane during certification and is not related to the actual RWY length provided at an aerodrome.

1.3.3 Use the code number to determine the applicable standards of obstacle-clear approach gradients, take-off gradients and takeoff survey areas for the RWY. The code number is not intended to limit aircraft operations at an aerodrome. Aircraft operators and/or pilots must ensure that the published aerodrome information meets requirements for their aircraft operations.

1.4. Obstacle-Clear Approach Gradients

- 1.4.1 The obstacle-clear approach gradient is normally based on the following standard:
- a. the threshold is located at least 60M from the intersection of the obstacle-clear approach surface with the extended RWY centre line; and
 - b. obstacle-clear approach gradients of:
 - (i) 5% for a code 1 RWY or MIL Visual APCH RWY up to 800M length,
 - (ii) 4% for a code 2 RWY or MIL Visual APCH RWY 800M up to 1200M length,
 - (iii) 3.3% for a code 3 and 4 RWY, and or MIL Visual APCH RWY 1200M up to 1800M length,
 - (iv) 2.5% for a MIL Visual APCH RWY 1800 M and over.
 - (v) 3.3% for NPA Code 1, 2 or 3 RWY;
 - (vi) 2% for NPA Code 4 and precision APCH RWY,
(MIL RWYs: 2.0% for 3000M, then 2.5% until outer horizontal surface, then horizontal).

1.4.2 Any variation to the standard is explained in a note under the relevant declared distances entry.

1.5. Obstacle-Clear Takeoff Gradients

1.5.1 Areas from the ends of runways, defined in accordance with the table below, are surveyed for obstacles. The obstacle-clear takeoff gradient is based on the greatest vertical angle with the horizontal subtended by an obstacle within the surveyed area. This gradient information is shown in brackets immediately following the TODA information. Liaise with the AD OPR if obstacle information is required.

1.5.2 Supplementary Takeoff Distances Available (STODA) are shown for obstacle-clear takeoff gradients (within the same defined area) of 1.6%, 1.9%, 2.2%, 2.5%, 3.3% and 5% if the TODA gradient exceeds these figures and the resultant STODA is greater than 800M.

1.5.3 Where an existing fence or levee is located very close to the RWY end, the fence or levee may not be taken into account in the assessment of the obstacle-clear takeoff gradients for TODA and STODA purposes. In such cases, information of the height and location of the fence or levee will be provided in a note under the relevant declared distances entry.

1.5.4 If the survey area is not in accordance with the table below, details of the actual obstacle survey area are provided below the relevant declared distances entry.

1.6. Takeoff Runway Survey Areas

Takeoff Climb Surface - Dimensions	Take-off Runways Code Number			
	1	2	3 or 4	MIL
Length of inner edge	60M	80M	180M	RWS WID
Minimum distance of inner edge from RWY end @	30M	60M	60M	CWY DIST
Rate of divergence (each side)	10%	10%	12.5%	13.2%
Final Width	380M	580M	1200M 1800M#	2518M
Overall length	1600M	2500M	15000M	15,000M\$

When the takeoff procedure includes changes of heading greater than 15DEG for operations conducted in IMC or VMC by night.

@ The takeoff climb surface starts from the end of clearway if a clearway is provided. \$3000M for RWYs < 1200M.

SLOPE: on RWY quoted is the difference between the maximum and the minimum elevation along the centre line of the RWY divided by its length and expressed as a percentage to the nearest one-tenth of a percent. The “down” slope and its direction are tabulated in all cases, e.g. “0.8% down to SE”. Where significant slope variations occur, additional data may be shown in notices, e.g. “E end level, centre section 0.5% down to W, W end 0.1% down to E”.

RWS WIDTH: is the width from side to side which contains the RWY, the graded and ungraded portions of the RWS, shown in metres only. The GRADED portion of the RWS may be defined by boundary markers and is graded to alleviate damage to an ACFT in the event that it runs off the RWY. The UNGRADED portion of the RWS is free of upstanding objects but may contain depressions, trenches, etc.

1.7. Climb/Descent Gradient Graph

FLIGHT PROCEDURES**1. ESTIMATED AIRBORNE TRAFFIC DELAYS****1.1. For ARR ACFT:**

- a. May be expected due to terminal area traffic density and/or single RWY operations:
 - (i) MON-FRI 2100-0000 UTC and 0600-1100 UTC: Less than 20MIN
 - (ii) SAT 2100-0000 UTC: 20MIN
 - (iii) SUN 0600-1100 UTC: 20MIN
 - (iv) DLY 0000-0600 UTC: 10MIN.

Note: Actual holding times may differ from holding estimates. Historical data on actual holding is available from the NOMC.

2. ATC TRAFFIC MANAGEMENT SPEED

When **not** on a SID or STAR (including vectoring) - ACFT ARR or DEP BN must not exceed 250KT IAS when BLW 10,000FT AMSL. Advise ATC if a higher speed is operationally required.

3. VFR ACFT DEP YBBN must FPL via either MBHB, TVT or BLHS.**4. Circling APCH PROC to RWY 01L/19R at night is not permitted, MIRL NOT AVBL.****5. AIR TRAFFIC FLOW MANAGEMENT PROCEDURES****5.1 Strategic ATFM - Runway Demand Management Scheme (RDMS)**

Brisbane RDMS is applicable to all airline and ACFT operators using Brisbane airport. All flights operating into and out of Brisbane must obtain an Airport Coordination Australia (ACA) slot in accordance with *AIP ENR 1.9*.

GA APN operations are subject to RWY/APN slot management. Approved slot holders operating on the GA APN are to confirm allocated parking with BAC Duty Manager prior to arrival.

For full information regarding the Brisbane RDMS see BAC website:

www.airportcoordination.org/airports/australia/brisbane-airport/.

5.2 Ground Delay Program (GDP)

Brisbane GDP is run on demand and promulgated by NOTAM BTN 2000-1300 UTC. GDP is applicable to all fixed wing, non-priority flights departing FM all Australian domestic airports, and arriving at Brisbane.

Flights to Brisbane during the operation of GDP must obtain an ACA slot and Calculated Off Blocks Time (COBT) in accordance with *AIP ENR 1.9*. The COBT can be obtained through their company or the NOMC on 1800 020 626^.

5.3. Flow Tactical Landing Slots

Flights inbound to Brisbane with a duration of less than 45MIN must:

- a. Validate their COBT with Brisbane Flow on 07 3866 3588 during HR of GDP; or
- b. Confirm a tactical landing slot with Brisbane Flow on 07 3866 3588 outside periods of GDP. Failure to do so will result in delays.

Flights departing YBAF, YBCG and YBSU for a landing at YBBN must CTC Brisbane Flow Controller on 07 3866 3588 prior to engine start.

For full information regarding the Ground Delay Program see *AIP ENR 1.9*.

6. INDEPENDENT PARALLEL APPROACH OPERATIONS**6.1. Refer to DAP EAST Brisbane Independent Parallel Approach User Instructions.**

7. ARRIVAL PROCEDURES

By day, ATC may use 2,400M RWY separation between ACFT arriving to RWY 01R/19L. Both ACFT may occupy the RWY during application of the standard.

8. DEPARTURES

- 8.1. Departures shall normally be cleared in the order in which they are ready for takeoff, except that deviations may be made from this order to facilitate the maximum number of departures with the least average delay.

9. PARALLEL OPERATIONS RUNWAY ASSIGNMENT

Unless instructed by ATC or operationally required, ACFT shall be issued the following runways:

9.1. Departures

- a. RWY 01L/19R for all jet aircraft to routes north and west, and
- b. RWY 01R/19L for all jet aircraft to routes south and east.

9.2. Arrivals

- a. RWY 01L/19R for all aircraft from routes north and west, and
- b. RWY 01R/19L for all aircraft from routes south and east.

9.3. Aircraft arriving via ENLIP

- a. RWY 01L/19L for all aircraft arriving via ENLIP STAR

Note 1: ACFT which operationally require a different runway from that assigned, must advise ATC at clearance delivery stage.

Note 2: RWY assignment is subject to Noise Abatement Procedures.

10. LOW VISIBILITY**10.1. Operations**

- a. For CASA approved operators, RWY 01R/19L and 01L/19R are capable of supporting take-offs with an RVR of not less than 350M.
- b. TWY LGT spacing supports use in visibility not less than:
 - (i) 550M RVR for TWY C12, C13, F1, J, L and P.
 - (ii) 350M RVR for all other TWY.
- c. Refer to *AIP DAP* for Aerodrome Ground Movement Charts.

10.2. Procedures

- a. LVP require restrictive measures during specific weather conditions. LVP protects the ILS sensitive and critical areas and ensures safe ground movements and the safety of ACFT conducting low VIS OPS.
 - b. Preparations for the activation of LVP are commenced when visibility has reduced to 1,500M. This ensures that the LVP are in forced when:
 - (i) the cloud ceiling is 210FT or less; or
 - (ii) the RVR is at or below 550M or the Runway Visibility (RV) is 800M or less when RVR is not available.
 - c. Intersection departures are not permitted. All aircraft will be directed to the full length of a runway for departure.
 - d. Any pilot unsure of their position whilst operating on the Manoeuvring Area must Hold Position (STOP) and immediately advise ATC.
 - e. Radio failure – Aircraft must hold position and await further guidance from a ‘follow me’ vehicle.
 - f. Instrument RVR is provided at touchdown zone, midpoint zone and end zone for each RWY.
 - g. In the event of failure of RVR, manual RWY visibility assessments will be provided.
 - h. ATC use an Advanced Surface Movement Guidance Control System (ASMGCS) to monitor ACFT and vehicles on the Manoeuvring Area.
 - i. If ASMGCS is unserviceable during LVP, ATC will restrict aircraft and vehicle access to the Manoeuvring Area.
 - j. Aircraft are limited to one movement at a time on any portion of the Manoeuvring Area unless stop bars are operational.
11. All TWY are suitable for use in conditions of greater than RVR 550M

LOCAL TRAFFIC REGULATIONS

1. RWY 14 - ACFT ABV 136,000KG landing RWY 14 must roll through and exit RWY via TWY K to avoid pavement damage from heavy braking. ACFT BLW 136,000KG landing RWY 14 can exit via TWY D if heavy braking not required.
2. All aircraft must provide their parked position/gate number to ATC on acknowledgement of airways clearance.
3. Pilots are encouraged to request "detailed taxi guidance" prior to landing or taxiing for departure or request follow-me service once on ground frequency if unsure of parking bay.
4. **Runway Incursion Hotspots**
- 4.1. RWY 17/35 at TWY B (Holding Point B RWY 17 is very close to the gable line for RWY 14).
- 4.2. RWY 35 after landing RWY 32 (RWY 35 often mistaken for an angled TWY).
5. LOCAL HELICOPTER OPS are to be conducted on the Western Grass which is the area contained by the blue gable markers to the west of RWY14/32 and north of the VOR. The Western Grass is not a designated helicopter landing site and separation is not provided between aircraft and/or obstructions on the ground while operating within the confines of the Western Grass. Upwind and final legs of Western Grass circuit operations are to be conducted parallel to RWY 14/32 unless otherwise approved by ATC.
6. **Training and Airwork Flights**
 - a. Circuit training see Noise Abatement
 - b. Circuit and Western Grass helicopter bookings, pilots must book a slot online at www.bookawk.com.
 - c. IAL Training: Pilots must book a slot online at www.bookawk.com. ILS training for ACFT BLW 5,700KG MTOW will not be approved outside 0900-1700 Local. Pilots must contact Brisbane Centre 07 3866 3694 for AWK ABV 1,500FT
 - d. NDB - A and VOR - A approaches will not normally be approved.
 - e. Training operations contrary to the prevailing traffic pattern/operational runway direction will not normally be approved.
 - f. HEL with skid landing gear not permitted to complete touch and go circuit training on paved SFC due to pavement damage.
7. Occasionally, TCAS advisories for ACFT operating in Gold Coast Terminal Control Area may occur due ATC procedures affecting VFR ACFT.
8. Pilots planned to BN must obtain a slot time for Brisbane prior to engine start, in accordance with BN INTL Air Traffic Flow Management Procedures (See BRISBANE INTL entry).
9. Pilots should ensure flight plan details are submitted for flight in Gold Coast Class C airspace, preferably through NAIPS or Flightwatch, well in advance of requesting SSR code allocation. Failure to do so will result in delays for airways clearance. The SSR code request is to be made on the appropriate FIA frequency. Pilots who are squawking an assigned discrete code may call Gold Coast TWR on 118.7 directly for airways clearance at or BLW 1,500FT.
10. Flights planned to depart Gold Coast above 6,000FT can expect airways clearance at 6,000FT. Higher levels can be anticipated on APP CTL FREQ.
11. Fixed and rotary wing ACFT are not to perform engine ground runs and related static operations on the GA APN and should utilise provided run-up bays.
12. **PARKING**

Overnight parking is no longer AVBL for all aircraft above 5,700KG MTOW, except for RPT aircraft. Itinerant parking requirements is available for 2HR or less, this will require prior approval FM airport management with a MNM notice of one clear working day (MON-FRI). Itinerant ACFT under 5,700KG must park north of TWY G, at the northern end of the GA APN.
13. **TWY K DEPARTURES**

ACFT departing RWY 32 must use TWY K intersection for departure. Full length AVBL if operationally required.
14. No HEL air taxi on the GA APN. HEL OPS limited to aiming point and HEL PRKG area only.
15. HEL OPS from the aiming point not available to or adjacent to TWY G, east of the air traffic control tower or south of TWY G.

FLIGHT PROCEDURES

1. ATC TRAFFIC MANAGEMENT SPEED

When **not** on a SID or STAR (including vectoring) - ACFT ARR or DEP CG must not exceed 250KT IAS when BLW 10,000FT AMSL. Advise ATC if a higher speed is operationally required.

2. Circuits from the Western Grass are to be conducted with upwind legs to remain inside the airport boundary fence and base turns to be made within the RWY14/32 threshold markers.

3. COASTAL TRANSIT IN CLASS G AIRSPACE

Due to high density traffic in coastal Class G Airspace between Cudgen Headland and Hastings Point, fly;

a. Southbound 1,000FT AMSL.

b. Northbound 500FT AMSL.

Concentrated TFC BTN Gold Coast and Southport at 500FT, see also SOUTHPORT CTAF procedures.

4. Aircraft requiring a transit of the GC CTR should plan to track via the VFR route depicted on the VTC as follows:

Northbound transit via the highway (inland) and contact Tower 118.7 approaching Cudgen Lake for ATC clearance.

Southbound transit via the highway (inland) and contact Tower 118.7 approaching Robina Town Centre for ATC clearance. Aircraft requiring to transit the CTR coastal may experience delays due high density traffic.

CTAF - AFRU 118.7

2. The preferred RWY for takeoff and landing is RWY 14.

3. Circuit training:

a. Not permitted BTN 1200-2000 UTC;

b. Where possible circuits should be distributed equally left and right of the RWY in use.

4. Preferred flight paths for turbojet and non turbojet ACFT ABV 5,700KG MTOW are contained in AIP DAP.

5. Outside TWR HR pilots are requested to use the same RWY for DEP and ARR - if operationally acceptable.

6. RWY 14 INSTR APCH PROC for turbojet and non turbojet ACFT ABV 5,700KG MTOW - noise preferred RWY 14 APCH:

a. RNP W RWY 14, RNP Y RWY 14;

NOISE ABATEMENT PROCEDURES

1. Consideration should be given to operate aircraft in such a manner that minimises the audible and visual impact such operations may have on the community.
2. When ARR or DEP from Margaret River pilots are encouraged to keep circuits as close as practicable to the airstrip to avoid populous areas and the town.
3. When taking off from RWY 20, pilots are encouraged to avoid flying over the eastern precincts of the town by making a shallow left turn at a safe height after take off and either depart to the east or climb to 1,500FT before turning to the west.
4. Pilots are requested to use standard non-towered rejoin and circuit altitudes.
5. Pilots are encouraged to land on RWY 20 when practicable to avoid flying close to the Margaret River town.
6. Takeoffs and landings can be made from either RWY, depending on prevailing conditions. Pilots are encouraged to avoid flying over or close to the town.
7. Pilots are requested to climb as soon as possible within the airstrip perimeter.
8. Pilots should maintain appropriate altitudes when flying in the vicinity of the airstrip i.e. - 1,500FT AGL for over fly and 1,000FT AGL for circuit.
9. Pilots are requested to adopt climb or cruise power settings as soon as possible after reaching an altitude of 500FT.
10. Pilots should avoid residential areas when possible, and otherwise remain above 1,500FT AGL and limit any orbits of the town area.

6. LOW VISIBILITY OPERATIONS

- 6.1. For CASA APV operators, RWY 16 and RWY 27 are capable of supporting low VIS take-offs without limit, however only:
 - a. RWY 16 and 27 are normally used for low VIS departures; and
 - b. RWY 16 is capable of supporting localiser guided takeoffs.

Note: Flight crew must inform ATC at start up about an intention to conduct a takeoff that requires localiser guidance.
- 6.2. Access to RWY 27 is via TWY P or TWY Q. Access to RWY 16 is via TWY B. Intersection departures are not permitted.
- 6.3. RWY 16 is the arrival RWY for low VIS operations and is capable of supporting Category II and III approaches.
- 6.4. Approved TWY exits are TWY G, TWY J and TWY K
- 6.5. The following TWY are NOT suitable for use in RVR conditions of less than a value of 350M:
 - a. TWY T between TWY P and TWY R.
 - b. TWY S between TWY Y and TWY J.
 - c. TWY W east of TWY S.
- 6.6. All TWY are suitable for use in conditions of greater than RVR 350M.
- 6.7. Refer to *AIP DAP* for Aerodrome Ground Movement Charts.

7. LOW VISIBILITY PROCEDURES

- 7.1. Preparations for the initiation of Low Visibility Procedures (LVP) are commenced when VIS has reduced to 1,000M and/or the cloud ceiling is at or below 500FT and is further reducing or VIS on any part of the AD is insufficient to exercise control on the basis of visual surveillance. LVP initiation may occur earlier if conditions deteriorate rapidly.
- 7.2. When RVR is at or below 550M (less than 800M if RVR not AVBL) or when the cloud ceiling is at or below the CAT I minima, the ILS critical and sensitive areas are protected and 'LOW VISIBILITY PROCEDURES IN FORCE' is declared.
- 7.3. LVP are progressively lifted when the cloud ceiling is above the CAT I minima and the visibility reaches 850M and is increasing.
- 7.4. In the event of failure of RVR equipment, RWY visibility assessments will be provided.
- 7.5. ATC uses Advanced Surface Movement Guidance Control System (A-SMGCS) to monitor ACFT and vehicles on the Manoeuvring Area.
- 7.6. If A-SMGCS is unserviceable during LVP:
 - a. ATC will further restrict operations on the Manoeuvring Area.
 - b. Position reporting procedures may be implemented.

8. FOLLOW ME SERVICE

- 8.1. Flight Crew must notify ATC if a 'Follow Me' service is required.

9. LAND AND HOLD SHORT OPERATIONS (LAHSO)

- 9.1. LAHSO is used at Melbourne. See the YMML RDS for 'LDA for LAHSO' information.
- 9.2. In the event of a go-around, ATC may assign an avoiding action turn to either ACFT.
- 9.3. A turn commenced at the minimum turn HGT for the ACFT, together with a climb at normal go-around climb rates, will provide adequate OBST clearance.

10. RWY 09 ARRIVALS AND RWY 16 DEPARTURES SIMULTANEOUS OPERATIONS

- 10.1. Simultaneous operations will be conducted with ACFT landing on RWY 09 and departing on RWY 16 from TWY E (370M FM RWY INT).

11. GROUND DELAY PROGRAM (GDP)**11.1. Inbound**

- a. Melbourne GDP are applicable to all fixed wing, non priority flights departing from all Australian domestic airports, and arriving at Melbourne BTN 2000-1400 UTC DLY (1HR earlier during HDS).
- b. Except as specified in the Note below, flights from all Australian airports are required to operate in accordance with COBT. The COBT can be obtained through their company or the NOMC Phone: 1800 020 626^.

Note: COBT generated by Perth Departure Management Program will take precedence over COBT generated by the Melbourne Arrivals GDP.

- c. Flights departing within a 60NM radius of Melbourne must also obtain a start clearance from the departure airport when active or from Melbourne ATC Phone: 03 9235 7337^

11.2. Outbound.

ACFT departing Melbourne AD for an Australian Airport with a GDP must contact ACD 127.2 after receiving an Airways Clearance and prior to start. ACD will check compliance with COBT before transferring to SMC 121.7.

12. CLEARANCE AND PUSHBACK PROCEDURES

When nominated on the ATIS all departures requiring a pushback must call ACD on 127.2 with their request. ACD will instruct flightcrew to "MONITOR GROUND" or "MONITOR GROUND ON 121.7". When clearance is AVBL "Melbourne Ground" (SMC) will issue the pushback clearance or other instruction.

NOISE ABATEMENT PROCEDURES

Noise Abatement Procedures (NAP) apply. Refer AIP DAP.

LOCAL TRAFFIC REGULATIONS**1. GENERAL**

- Parking restrictions may apply to ACFT over 5,700KG. Itinerant operators may obtain details from the AD Operations Officer 0418 335 549 prior to arrival.
- TWY J AVBL for exit only RWY 17/35.
- TWY J RESTR to daylight hours only and ACFT under 25,000KG.

2. AIRWORK WITHIN ML TERMINAL AREA

- All ACFT planning AWK WI ML Terminal Airspace require prior ATC approval.
- Pilots must contact the ML Traffic Manager on 03 9235 7337^ to book a time slot.

3. INSTRUMENT APPROACH TRAINING

- All ACFT planning practice instrument APCH (AVBL 2000-1100 UTC, 1HR earlier during HDS) RQ prior ATC approval. Pilots must book a slot online at www.bookawk.com. Airwork booking for the following days will not be taken until after 0800 UTC.
- Practice instrument approaches with circling or overshoot are restricted to ACFT below 30,000KG MTOW.
- Pilots are to ensure accurate compliance with missed approach instructions issued by TWR controllers. Due to the proximity of ML AD, varying break-off points may be issued. Training requirements must not inhibit compliance with ATC instructions. Simulated engine failure is subject to ATC approval.

4. For CASA approved operators, all RWYs are capable of supporting takeoffs with an RVR/ RWY VIS of 800M or more.

5. HELICOPTER OPS

- Helicopter operation to the northern APN and northern hangars restricted to APV operators. CTC AD OPR.
- Hangars 18 and 19 (Hart Precinct) restricted to APV operators. CTC AD OPR. HEL are not to directly ARR/DEP from APN unless operationally required by ATC.
- During daylight hours HEL AWK may be taking place from a training site contained within an area BTN the GP antenna, 150M radius east of the anemometer, TWY N and RWY 08/26 clear of the marked runway strip, known as the Eastern Grass. HEL OPS not ABV 100FT AGL. HEL not to OPR within 150M of the BoM anemometer. Restricted to APV OPR. CTC AD OPR.

6. FLIGHT PLAN RQMNTS - Refer to ERS A GEN.**FLIGHT PROCEDURES****1. ESTIMATED AIRBORNE TRAFFIC DELAYS**

1.1. For ARR ACFT:

- May be expected due to terminal area traffic density:
 - MON-THU 0845-0945 Local: 10 MIN
 - FRI 0945-1045 Local: 10 MIN.

Note: Actual holding times may differ from holding estimates. Historical data on actual holding is available from the NOMC.

2. ATC TRAFFIC MANAGEMENT SPEED

When **not** on a SID or STAR (including vectoring) - ACFT ARR or DEP EN must not exceed 250KT IAS when BLW 10,000FT AMSL. Advise ATC if a higher speed is operationally required.

3. When EN TWR is active, EN TWR is allocated the SE quadrant of ML CTR and adjacent C airspace step up to 2,000FT. ACFT wishing to OPR in this airspace must call EN TWR 125.1 at VFR APCH points. Pilots are REQ to display landing lights when possible.

4. ACFT operating in EN TWR airspace shall SQUAWK code 0100 unless assigned another code.

5. Due to the proximity of ML AD, it is essential that pilots comply accurately with tracking instructions.
6. Start clearance required for ACFT departing EN for ML for airwork in the ML Terminal Area or for practice instrument APCH on DEP.
7. Start clearance RQ for ACFT departing EN for MB ABV A020 and ACFT departing EN for AV above A020.
8. **OPERATION OUTSIDE TWR HR:**
 - a. Outside TWR hours, ML APP is responsible for all ACFT operating into and out of EN AD, including the SE quadrant of the ML CTR normally controlled by EN TWR. Due to the special nature of this non TWR operation and the restrictions imposed on the use of the runways, all aircraft may expect delays. Lodgement of a flight plan is required for OPR in this airspace outside TWR hours (refer AIP DAP East for exemptions).
 - b. DEP ACFT must obtain a start clearance on 118.45.
 - c. ACFT requesting a clearance from OCTA through that airspace normally allocated to EN TWR shall obtain airways clearance from ML Centre on 135.7.
 - d. In the event of radio failure on the ground, continue to TX intentions, return to apron and contact ATC on 03 9235 7337^.
 - e. Taxi, landing or takeoff clearances will not be issued. Pilot in command has sole responsibility for ACFT ground movement and avoidance of other ACFT and obstacles. all ACFT must notify ground movement on 118.45. Advice of other traffic on the manoeuvring area will be provided.
 - f. RWY must not be used for taxiing or run-ups, but clearance is not RQ to cross a RWY.
 - g. ATC will instruct ACFT taxiing for departure to report "ready" at the RWY HLDG point for departure instructions. ACFT must not enter the departure RWY until specific departure instructions are issued.
Note: An airways clearance does not constitute departure instructions.
 - h. ACFT must commence takeoff within three (3) minutes of issue of DEP instructions, otherwise new instructions must be obtained.
 - i. SAR WATCH will commence after issuance of departure instructions.
9. **CIRCUITS OR SIMULATED ENG FAILURES**
 - a. All ACFT planning circuits require prior ATC (EN Tower) approval.
 - b. Circuits or simulated engine failures at EN are subject to the following limitations:
 - (i) ACFT MTOW not above 5,700KG and must be propeller driven;
 - (ii) Low level circuits not below the circling minima.
10. **MULTI-ENGINE ACFT:**
 - a. Circuits AVBL HR 2100-1200 UTC.
 - b. **ASYMMETRIC OPS INVOLVING FEATHERING OF PROPELLERS NOT PERMITTED.**
 - c. May simulate ENG failure under the following conditions:
 - (i) HJ only;
 - (ii) Only RWY 35 full length to be used;
 - (iii) In retractable undercarriage ACFT, simulated ENG failure after TKOF is not to be initiated prior to selecting undercarriage up;
 - (iv) ACFT to be under the command of a pilot possessing current multi-ENG endorsement approval.
11. **SINGLE ENGINE ACFT:**
 - a. Circuits AVBL HJ for endorsement and test flights only.
 - b. **SIMULATED ENGINE FAILURES NOT PERMITTED.**
12. **GROUND DELAY PROGRAM (GDP)**
- 12.1. Essendon Arrivals during Melbourne GDP
 - a. When the Melbourne TAF indicates a visibility of less than 5,000M and a ceiling of less than 1,600FT an Essendon Slot Scheme may be operating. This is dependant on weather and runway configurations planned to be in operation between the two Airports during the GDP, as Essendon Arrivals may become part of the arrivals sequence into Melbourne.
 - b. Fixed wing ACFT arriving at Essendon during these periods must contact the National Operations Management Centre (NOMC) on 1800 020 626^ to book a slot for arrival into Essendon.

- c. Operators who upload a schedule into Metron Harmony or provide a schedule to the NOMC will have their ACFT automatically assigned a slot. ACFT operators will still need to confirm their allocated slot time with the NOMC.
- d. All ACFT subject to the Essendon slot scheme must arrive within -5/+15 minutes of their allocated Slot. Pilots unable to operate within the compliance window must contact the NOMC to obtain a new Slot.
- e. Failure to obtain or comply with a Slot and/or to submit a flight plan for a flight to Essendon Airport may result in extensive airborne holding or Airways Clearance being withheld if Essendon Airport has no compatible arrival Slots available.
- f. A NOTAM will be issued notifying times the Essendon Slot Scheme is in operation or cancelling it if weather conditions change.
- g. Priority Flights as defined in *AIP ENR 1.4*, are exempt from this procedure.

NOISE ABATEMENT PROCEDURES

1. The Air Navigation (Essendon Fields Airport) Regulations 2018 impose a MTOW limitation on operations at Essendon Airport.
 - a. An operator of an aircraft must not engage in conduct that results in an aircraft taking off from, or landing at, Essendon Fields Airport if the aircraft has a MTOW of 45,000KG or more.
 - b. Paragraph 1.a. does not apply if the aircraft has MTOW of no more than 50,000KG and the associated legislative requirements are applied.
 - c. The regulation is available online:
<https://www.legislation.gov.au/F2018L01687/latest/downloads>
2. Additional noise abatement procedures apply (see *AIP DAP East*).
3. State aircraft are exempt from curfew requirements (hours of operation and MTOW limits) and are requested to apply fly neighbourly procedures at Essendon Fields Airport.

Pilots must conduct a visual missed approach ensuring that the aircraft remains north of the PH CTR and below the overlying CTA at all times.
4. **OPERATIONAL READINESS PLATFORMS**
 - a. ORP WI RWS E and W of THR RWY 18/36 may contain vehicles or MIL ACFT at any time. ACFT/vehicles in ORP will be no closer than 8M FM RWY edge. ACFT with wingspan of 40.5M (133FT) or less permitted to TKOF and land with either ORP in use. TWR will advise visiting arriving ACFT through the phraseology "Approach and/or departure end ORP/s in use". Visiting departing ACFT will be advised that the DEP end ORP is in use. ACFT captains may refuse to use the RWY until ORP is vacated. In such instances delays can be expected.

FLIGHT PROCEDURES

1. Right hand circuits RQ when OPR on RWY 18 or 23.
2. **ATC TRAFFIC MANAGEMENT SPEED**
When **not** on a SID or STAR (including vectoring) - ACFT ARR or DEP PE via Class C airspace must not exceed 250KT IAS when BLW 10,000FT AMSL. Advise ATC if a higher speed is operationally required.
3. **PEARCE PARALLEL RWY POLICY**
Parallel RWY OPS are to cease while a non-local aircraft is occupying the RWS 18/36.
4. **NON-LOCAL AIRCRAFT ARR AND DEP**
 - a. 15 MIN holding fuel RQ for visiting ACFT ARR at Pearce.
 - b. All visiting ACFT are to PLN via Perth for ARR and DEP. ARR - Expect STAR with vectors for Pearce WI 10DME Perth. DEP - on CLR issue expect tracking via Perth TFC Management RTE. Tracking is dependent on RWY in use at Perth.

5. MILITARY AIRSPACE - ACCESS PROCEDURES**5.1. Access to MIL airspace is available as follows:**

Non pressurised flights 5,000FT and BLW (levels up to 10,000FT may be available on request) may plan to transit R156/R163/M166/M171A via a track established on W14 route from OTKUN (YRTI) - UPTKEK - BUVEL (YJNB) or reverse. All ACFT planning this route are to be equipped with a serviceable transponder. A Class D radar service will be provided by Pearce ATC on this route.

5.2. Flights other than those wishing to track via the transit areas are to obtain prior authority as FLWS:

- a. VFR operators wishing to transit PEA restricted areas are to contact PEA ATC at least 10MIN prior to the restricted area boundary and request clearance. The availability of the clearance will be determined by MIL flying activity. Clearance to transit R155AB will not normally be available.
- b. Tracking via the COT is AVBL outside of Pearce Restricted Areas.
- c. Separation will be provided for VFR flights in Pearce Restricted Areas in accordance with a Class C radar service.
- d. ACFT wishing to operate in PEA Restricted Areas during normal PEA OPR HR are required to obtain prior authority by telephoning Approach Supervisor (08 9476 8622) not later than 0700 UTC on the last normal working day prior to the activity.

FLIGHT PROCEDURES

1. ESTIMATED AIRBORNE TRAFFIC DELAYS

- 1.1. Estimated airborne traffic delays for ARR ACFT may be expected due to terminal area traffic density:
 - a. MON and FRI
 - (i) 0100-0500 UTC: 10 MIN.
 - (ii) 0500-0900 UTC: 5 MIN.
 - (iii) 0900-1300 UTC: 10 MIN.
 - b. TUE, WED and THU
 - (i) 0100-0500 UTC: 20 MIN.
 - (ii) 0500-0900 UTC: 5 MIN.
 - (iii) 0900-1300 UTC: 20 MIN.

Note: Actual holding times may differ from holding estimates. Historical data on actual holding is available from the NOMC.

2. ATC TRAFFIC MANAGEMENT SPEED

When not on a SID or STAR (including vectoring) - ACFT ARR or DEP PH must not exceed 250KT IAS when BLW 10,000FT AMSL. Advise ATC if a higher speed is operationally required.

3. ARRIVAL PROCEDURES

By day, ATC may use 2,400M RWY separation between ACFT ARR to RWY 03/21. Both ACFT may occupy the RWY during application of the standard.

4. AIR TRAFFIC FLOW MANAGEMENT PROCEDURES

- a. A slot allocation system and a ground program (GDP) applies at Perth airport. Details including the allocation and use of Calculated Off Blocks Time (COBT), can be found in *AIP ENR 1.9*.
- b. The arrival GDP applies to all fixed wing, non-priority flights departing from all Australian domestic airports and arriving at Perth between 0030-1400 UTC MON-FRI. In addition, flights departing from Jandakot for a landing at Perth must contact Perth Centre on 135.25 prior to starting engines.
- c. The departures GDP applies to all fixed wing, non-priority flights departing Perth between 2130-0030 UTC MON-FRI. PH SMC will make a general broadcast on 121.7 and 122.2 advising early clearance is AVBL when demand is lower than capacity due to gate delays.
- d. During periods when start approvals are required due extensive DLA, ACFT will be assigned a 'start sequence number' at clearance issue. When issuing a start approval, the Ground Controller will quote that ACFT 'start sequence number' to assist other ACFT in determining their position in the start order. If assigned a start sequence number pilots must monitor ground 121.7 and 122.2 for this advice and start approval. Operators may request to swap start sequence numbers of own company ACFT by contacting Perth Tower via phone 08 9476 8625.

- a. May be expected due to terminal area traffic density:
 - (i) 2000-1300 UTC DLY: 15 MIN.

Note: Actual holding times may differ from holding estimates. Historical data on actual holding is available from the NOMC.

2. ATC TRAFFIC MANAGEMENT SPEED

When not on a SID or STAR (including vectoring) - ACFT ARR or DEP BK via Class C airspace must not exceed 250KT IAS when BLW 10,000FT AMSL. Advise ATC if a higher speed is operationally required.

Note: Pilots must also comply with Class D airspace speed limits. Cancellation of ATC traffic management speeds does not cancel Class D airspace speed limits.

3. IFR OPERATIONS IN VMC

Pilots electing to commence or terminate an IFR flight under the VFR should communicate such intention at the earliest possible time to ensure their arrival or departure is processed efficiently.

4. LOW VISIBILITY OPERATIONS

Low Visibility Operations not AVBL.

5. LOCAL PROCEDURES

Except when on climb or descent, pilots of multi-engined ACFT should operate not below 1,500FT AGL in D539A and D539B, unless operation at this altitude would jeopardise the safe conduct of the flight.
- d. If unsure of position request assistance from SYDNEY 125.8.

7. All OPS unable to visually navigate clear of the SY CTR must obtain an airways clearance prior to departure.
8. Airways clearance requests to enter SY CTR must be made on BANKSTOWN GROUND 119.9 during the hours of activation of Bankstown TWR, or SYDNEY CENTRE 125.8 PRI / 124.55 SEC, when BK CTR is deactivated.

- 16.5 HEL LANES. HEL transit and access lanes are established within R405 A and B details of which are provided BLW. Except as authorised by CASA, OPS by HEL WI R405 A and B must be confined to the HEL lanes, and SEAPLANES must be confined to transit lanes, for other than climb and descent to landing sites immediately adjacent to the lanes.
- 16.6 MIL HEL ABV 2,500KG MTOW may transit R405B E of Fort Denison over water, not ABV 1,000FT on QNH, for access to MIL establishments WI R405.
- 16.7 SEAPLANES may operate in R405 A and B as follows:
- over water at all times;
 - WI R405A not above 500FT on QNH;
 - WI R405B not above 1,000FT on QNH;
 - not use any HEL access lane; and
 - no OPS beneath the Sydney Harbour Bridge or Gladesville Bridge except as authorised by CASA and the Sydney Harbourmaster.
- 16.8 BROADCAST intentions entering and leaving R405 on FREQ 120.8 MHz. This FREQ is not monitored by Airservices Australia.
- 16.9 Entry into R405B from the east, and departure from R405B to the east, must be made over water via Sydney Heads. Transit from Victor 1 overland into R405B is not permitted.
NOTE: EMERGENCY TRANSMISSIONS SHALL BE MADE ON 124.55 MHz.
17. **HEL TRANSIT AND ACCESS LANE PROCEDURES (Refer associated diagram)**
- The ALT specified for each lane shall be maintained during lane transit.
 - Pilots are to keep to the right when flying along a HEL lane.
 - Pilots unfamiliar with the HEL lanes and PROC shall obtain a briefing FM a local HELOPR or Flying School.
 - HEL transit lanes are to be considered as access lanes for the purpose of *CASR 91.265(4)(g)* and *91.267(3)(j).(3A)*.

The harbour lane FLW the Parramatta River FM Silverwater to Ryde Road bridge, Gladesville Bridge, the southern pylon of Sydney Harbour Bridge, ABM Bradley's Head, ABM Middle Head, Sydney Heads and thence coastal to Long Reef. The lane is over water. The ALT to be flown are:

- e. Not BLW 700FT on QNH from Silverwater to Ryde road bridge;
- f. 500FT on QNH BTN Ryde road bridge and the Harbour Bridge;
- g. 1,000FT on QNH BTN the Harbour Bridge and Middle Head, Climb and descent to be conducted east of the Harbour Bridge.
- h. Not ABV 1,000FT on QNH, over water, BTN ABM Middle Head and Long Reef.

18. **HELICOPTER ACCESS LANES**

- a. LANE COVE RIVER LANE. An access lane from Gladesville Bridge to Pennant Hills via Northern Suburbs Cemetary follows the Lane Cove River valley to Pennant Hills. The ALT to be flown are:
 - (i) 500FT on QNH between Gladesville Bridge and Delhi Rd;
 - (ii) 700FT on QNH between Delhi Rd and Pennant Hills.
- b. NORTH SHORE LANE. An access lane for the HLS near the Royal North Shore Hospital/Channel 9/Channel 2 is shown on the expanded diagram ABV. The ALT to be flown is 1,000FT on QNH.

19. **VFR COASTAL ROUTE VICTOR 1**

19.1 **General**

Transit of the Sydney area is available via a VFR Coastal Route within the Class G airspace east of the Sydney Control Zone and Control Area. The route comprises **Victor 1 NORTH** and **Victor 1 SOUTH** which are differentiated by the lower limits of the overlying Class C airspace and by their tracking requirements.

- a. The Coastal Route is depicted on the SY VTC and Sydney General Flying Guide (SY GFG) and may be flown in either direction. Operations are restricted to VMC by day only.
- b. Pilots are required to use SY Local QNH, available on the SY ATIS. If transponder equipped, squawk code 1200 with ALT.
- c. The carriage and use of radio is mandatory.
- d. Operations in the Coastal Route share a common VHF broadcast frequency (120.8 MHz) with helicopter and floatplane operations in R405A and R405B over Sydney Harbour.
- e. Pilots should broadcast joining the Coastal Route, stating position and intentions. Pilots of opposite direction aircraft should respond with position and intentions. Landing lights and strobes should be activated and pilots should be alert for opposite direction traffic. If possible, keep opposite direction traffic to your left.
- f. Broadcast frequency 120.8 MHz is not monitored by SY ATC. In the event of an emergency, pilots are advised to call Sydney Centre on 125.8 MHz or 124.55 MHz, or to make an emergency broadcast on 121.5 MHz. This frequency is usually monitored by domestic and international transport aircraft.
- g. All occupants of single-engine aircraft must wear approved life jackets for the duration of the overwater portions of the Coastal Route.
- h. High speed military aircraft are requested to remain clear of the Coastal Route.

19.2 **Procedures for Operations in Victor 1 South**

- a. **Victor 1 SOUTH** extends East of the coast between the South Head of Sydney Harbour and Jibbon Point (the southern Headland of Port Hacking) and includes three coastal HLS at Wanda Beach, Cape Baily and Cape Banks. Pilots are required to maintain an altitude of exactly 500FT on Sydney Local QNH when operating in this airspace.
- b. The requirement in **Victor 1 SOUTH** is to contain your aircraft in Class G airspace and clear of the SY CTR.
- c. To avoid the SY CTR you must NOT Coastal Fly the Sydney southern beaches between Ben Buckler (the northern headland of Bondi Beach) and Long Bay headland (the southern headland of Maroubra Beach), and fly east of a straight line between the eastern most point of Cape Banks and the lighthouse on Cape Solander (the north and south heads of Botany Bay).

- d. The term 'Coastal Flying' refers to the practice of flying close to the beach and following the contours of the coastline. This practice is NOT permitted when flying in **Victor 1 SOUTH** between Ben Buckler and Cape Solander.
 - e. Some helicopters and beach patrol aeroplanes may have been cleared to coastal fly between Bondi and Maroubra and may not continuously monitor 120.8 MHz.
 - f. The CTA lower limit south of Jibbon Point and east of the coast is 1,000FT. North of Jibbon Point the lower limit of the CTA is 500FT.
- 19.3 **Wake Turbulence Risk in Victor 1 South**
- a. Runway information is available on the SY ATIS and will assist pilots to anticipate aircraft overflying **Victor 1 SOUTH** to or from Sydney Airport and to determine the wake turbulence risk.
 - b. The wake turbulence standard of 1,000FT vertical separation from heavy aircraft may not always be achievable when flying in **Victor 1 SOUTH**.
 - c. Under normal circumstances, aircraft arriving and departing Sydney airport will be at least 500FT higher than the CTA step (500FT higher than traffic on **Victor 1 SOUTH**). However, there is always the possibility of an aircraft departing Sydney airport experiencing impaired performance and, under these circumstances, the 500FT vertical separation design buffer might be infringed. Pilots flying in **Victor 1 SOUTH** should be aware of the possibility of this occurrence, and of the requirement to see and avoid all other aircraft.
 - d. Because of the unpredictable nature of wake turbulence, pilots must remain vigilant of the proximity of a heavy aircraft, and on becoming aware of the presence of such an aircraft, adjust their flight path to remain well clear of the affected airspace.
 - e. The recommended wake turbulence separation standard behind and below a medium or heavy aircraft is 6NM or 3 minutes.
- 19.4 **Procedures for Operations in Victor 1 North**
- a. **Victor 1 NORTH** extends east of the coast between Dee Why (12DME SY) and the South Head of Sydney Harbour and has a maximum altitude of 1,000FT on SY Local QNH.
 - b. All operations in **Victor 1 NORTH** must be conducted between 500FT and 1,000FT.
 - c. Operations in **Victor 1 NORTH** below 1,000FT must remain over water at all times.
 - d. South Head is the northern limit of **Victor 1 SOUTH** and pilots should ensure that their aircraft remains clear of Class C airspace when transiting from **Victor 1 NORTH** to **Victor 1 SOUTH**.
 - e. Ensure that you reach 500FT before passing South Head southbound.
20. **SIGHTSEEING FLIGHTS OVER SYDNEY HARBOUR**
- 20.1 **Harbour Scenic Flights**
- a. The airspace above Sydney Harbour is Class C and availability of an airways clearance to enter it will depend on traffic levels, controller workload and VMC.
 - b. You should submit flight notification before your flight to minimise delays and you may be cleared for one of two standard scenic flight routes, 'Harbour Scenic ONE' or 'Harbour Scenic TWO' which are described below.
 - c. The routes are flown at an altitude of 1,500FT on Sydney Airport Local QNH, which is available on the SY ATIS.
- 20.2 **Airways Clearance Requests**
- a. Track via Class G airspace to Long Reef. Contact Sydney Terminal (135.1 MHz) prior to reaching Long Reef and request a 'Harbour Scenic'.
 - b. You must remain in Class G airspace until in receipt of a clearance, which will be in the form, 'Cleared Harbour Scenic ONE' (or 'TWO').
- 20.3 **Coded Clearances**
- a. A 'Harbour Scenic' clearance authorises you to fly the nominated route at 1,500FT.
 - b. Your read back of 'Cleared Harbour Scenic ONE' (or 'TWO') acknowledges that you will track via the nominated route and maintain 1,500FT.
- 20.4 **Harbour Scenic One**
- a. At 1,500FT AMSL, track Long Reef direct to the Harbour Bridge.
 - b. Remain east of the Harbour Bridge and commence a left turn, remaining North of the Opera House.
 - c. Conduct 2 left orbits, remaining east of the Harbour Bridge, north of the Opera House and west of Garden Island.

- d. On completion of the second orbit track via North Head to Manly Beach.
 - e. From Manly Beach track east of the coast to Long Reef. Report passing Manly northbound. Refer following para.
- 20.5 **Harbour Scenic Two**
- a. At 1,500FT AMSL, track Long Reef direct to Chatswood Central Business District (CBD).
 - b. Conduct 2 left orbits, remaining east of the Chatswood CBD and west of the Roseville Bridge.
 - c. On completion of the second orbit track to Manly Beach.
 - d. From Manly Beach, track east of the coast to Long Reef.
 - e. Report passing Manly northbound. Refer following para.
- 20.6 **Entry into Victor 1 South Following a Harbour Scenic**
- a. Request DESCENT into **Victor 1 SOUTH** approaching Manly Beach.
 - b. Subject to traffic, and when established east of the coast, you may be cleared to leave the control area on descent.
 - c. Report to ATC leaving 1,500FT then broadcast position and intentions on 120.8 MHz. In aircraft with a single radio you will need approval to leave the ATC frequency to make this broadcast.
 - d. You must reach 500FT before passing South Head southbound.
 - e. Report to ATC when established at 500FT in **Victor 1 SOUTH**.
- 20.7 **Additional Information**
- Expanded details and a diagrammatic representation of these procedures are provided on the Sydney General Flying Guide.

If unfamiliar, contact TW ATC prior to departure for clarification.

The following procedures must be read in conjunction with the TW VTC.

3. RUNWAY NOMINATION

- 3.1. RWY12R/30L on FREQ 118.25 shall be used for:
 - a. ALL single engine VFR ACFT ARR and DEP from the 160R through west to the 295R:
 - (i) ARRIVALS via Duri Gap (DUA) (see para B)
 - (ii) DEPARTURES via GATE SOUTH (GST) or GATE WEST (GWT) (see para 4)
 - b. single engine ACFT circuit training.
- 3.2. RWY12L/30R on FREQ 119.4 shall be used for all other OPS.

4. ARRIVALS VIA DURI GAP (DUA)

- a. Route for single engine VFR ACFT from the 160R through west to the 295R;
- b. FREQ 118.25;
- c. RWY12R/30L;
- d. CAUTION: Pilots can mistake Mt Terrible and Soma MTN for Duri MTN. Pilots should confirm Duri MTN with the location of Currabubula and the Tamworth-Werris Creek railway line. Mis-identification will lead to conflict with any opposite direction traffic outbound via Gate South (GST);

- e. Clearance required prior to DUA at **3,000FT AMSL**;
- f. CAUTION: D523 is a high traffic density flying training area. ACFT recovering D523 track via DUA at 3,000FT. ACFT approaching DUA must be alert to increased traffic density and visually maintain separation from other ACFT;
- g. Report at 5NM for circuit entry instructions;
- h. **DO NOT CROSS N OF RWY12R/30L CENTRE LINE** due to operations on the parallel RWY 12L/30R;
- i. In the unlikely event of frequency congestion or radio failure after receiving clearance, **MAINTAIN 3,000FT AMSL** and join upwind overhead the duty RWY (12R/30L) threshold. Maintain separation with other aircraft and descend to circuit altitude.

5. **DEPARTURES VIA GATE SOUTH (GST) OR GATE WEST (GWT)**
 - a. Route for single engine VFR ACFT from the 160R through west to 295R,
 - b. FREQ 118.25,
 - c. When number one at the holding point, pilots must report "READY" with intended route; "READY GATE SOUTH [or WEST]".
 - d. **VIA GATE SOUTH (GST)**
 - (i) RWY 12R - from right crosswind; or
 - (ii) RWY 30L - from left downwind;track to ABM Warral Silo (WASL) NOT ABOVE 2,500FT AMSL and remain west and within 1NM of the Werris Creek railway line. From ABM WASL, remain NOT ABV 3,000FT AMSL until clear of controlled airspace.
 - e. **VIA GATE WEST (GWT)**
 - (i) RWY 12R - from right downwind; or
 - (ii) RWY 30L - from left crosswind;track to become established to the south of the East-West power line NOT ABOVE 2,500FT AMSL. From 5NM (ABM Fullwoods Hill) remain NOT ABV 3,000FT AMSL and track to Gate West remaining south of the power line until clear of controlled airspace.
 - f. a departure report is not required and pilots should automatically change to the appropriate FREQ when clear of controlled airspace.
6. **CIRCUIT OPERATION**
 - a. Report 'ready' in the run-up bay for instructions.
 - b. ALT not ABV 2,500FT AMSL.
 - c. PPR from AD OPR for NGT CCTS.
7. **INSTRUMENT TRAINING AND AWK**
 - a. All ACFT planning practice instrument APCH, NAVAID training or AWK require prior ATC approval. Pilots must book a slot online at www.bookawk.com.
 - b. Bookings may be subject to cancellation by ATC:
 - (i) on daily review of forecast MET conditions.
 - (ii) due to OPR restrictions.
 - c. Pilots requesting an APCH to the non-duty RWY may expect extended delay. Conduct of an APCH to the non-duty RWY is not guaranteed.
8. **SIMULTANEOUS PARALLEL RWY OPS**
- 8.1. During TWR HR, ATC may conduct simultaneous parallel runway operations provided that:
 - a. operations are conducted in VMC by day only;
 - b. conditions permit continuous visual monitoring by ATC of ACFT on base and during the turn onto final; and
 - c. continuous two way communications are maintained between the ACFT and ATC.
- 8.2. Notification of simultaneous parallel runway operations will be broadcast on ATIS or by directed broadcast to aircraft; "SIMULTANEOUS PARALLEL RUNWAY OPERATIONS IN USE. EXPECT TRAFFIC ON FINAL AND OPPOSITE BASE OF THE PARALLEL RUNWAY".
- 8.3. Simultaneous parallel RWY operations will normally be conducted utilising separate frequencies.
- 8.4. When simultaneous parallel runway operations are being conducted, pilots are responsible for:
 - a. ensuring that the runway centre line is not crossed during intercept of final;
 - b. accurately tracking the centre line on final and upwind; and
 - c. maintaining a visual lookout for ACFT approaching and departing the parallel RWY.
9. **LOW VISIBILITY OPS**
- 9.1. RWY 12L/30R supports takeoffs down to 800M RV during TWR HR only.
- 9.2. ATC will initiate Low Visibility Procedures when RV is below 800M or ceiling is 200FT or less.
- 9.3. Outside TWR HR - CTAF procedures apply.

The Katherine Helicopter Corridor is established for helicopters transiting between the following locations: Katherine Railway Station, Springvale Homestead, Moonraker, Katherine Showgrounds, Katherine Hospital, Katherine Museum, Kumbidgee Lodge Helipad, Maude Creek Airstrip and Katherine Gorge Helipad.
The corridor is defined as 1NM either side of the Victoria Highway between the Katherine Railway Station and the intersection of the Victoria Highway and Stuart Highway, thence 1NM either side of the Katherine River between the Stuart Highway Bridge and the Katherine Gorge Helipad.
ACFT east bound will keep to the north of the Katherine River/Victoria Highway. ACFT west bound will keep to the south of the Katherine River/Victoria Highway.
When Tindal CTR is active, ACFT must CTC Tindal APP prior to becoming airborne. ACFT requesting clearance to any other locations within the corridor will be cleared as such:

SPECIAL USE AIRSPACE (SUA)

1. GENERAL INFORMATION

- 1.1. Information regarding SUA areas is published in *AIP ENR 1.4* and the *DAH*.
- 1.2. Time throughout this section is normally shown in UTC. Where Local time is intended it will be followed by Local.
- 1.3. Hours of operation referring to public holidays refers only to national holidays as listed in *AIP GEN 2.1*. Any other holidays affecting activation will be specified by NOTAM.

2. MILITARY AIRSPACE GROUPS

- 2.1. SUA belonging to Military Airspace Groups will be indicated in brackets with a group code alongside the SUA IDENT, e.g. R129 (PEX).
- 2.2. Military Airspace Groups define a group of SUA areas for NOTAM briefing.
- 2.3. Military Airspace Group codes, e.g. PEX can be used in NAIPS location briefings, SPFIB and on the Pilot Website Restricted Area Briefing Tool.

3. CONDITIONAL RESTRICTED AREA (RA) STATUS

- 3.1. In order to assist with shared use of airspace, all RA have been allocated a RA conditional status. This will be an indication as to the likelihood of obtaining a clearance to fly through restricted airspace. NOTAM may be issued to indicate changes to the RA conditional status, which should be checked prior to flight planning.

3.2. RA conditional status legend

- a. RA1: pilots may flight plan through the RA and under normal circumstances expect a clearance from ATC.
- b. RA2: pilots must not flight plan through the RA unless on a route specified in *GEN-FPR* or under agreement with the Department of Defence, however a clearance from ATC is not assured. Other tracking may be offered through the RA on a tactical basis.
- c. RA3: pilots must not flight plan through the RA and clearances will not be available.
Note: In a declared emergency, every effort will be made to obtain approval to transit a RA, irrespective of its conditional status.

4. MILITARY OPERATING AREAS (MOA)

- 4.1. MOA are a subset of danger areas. They are primarily established outside Australian territory in Australian administered airspace for use by the Australian Defence Force for military training and exercises.
- 4.2. Outside Australian territory, only Australian registered aircraft are restricted from entering MOA unless they have Administering Authority approval. Within Australian territory, both foreign registered and Australian registered aircraft are restricted from entering MOA unless they have Administering Authority approval.
- 4.3. It is highly recommended that foreign registered aircraft make appropriate safety contact with the relevant Administering Authority if they choose to enter an active MOA outside Australian territory.

6.7. Melbourne CTR - Overflying IFR and VFR Flights

Due to separation requirements with Melbourne INTL jet traffic, the minimum ALT for ACFT planning to overfly the Melbourne CTR is 6,000FT (except for OPS to and from Melbourne or Essendon airports).

IFR ACFT with OPN RQ for a lower altitude due to low freezing level must contact the ML Traffic Manager (03) 9235 7337 to make suitable arrangements.

6.8. Alternative Routes

Any variation to the above flight planning requirements requires prior approval from the ML Traffic Manager (03) 9235 7337.

SPECIAL PROCEDURES (NOT ASSOCIATED WITH AN AERODROME)**1. SP 1 - BASS STRAIT CROSSINGS****1.1 Recommended Routes**

- 1.1.1 These routes do not replace compliance with any requirements or equipment for flight over water, found in the relevant *CASR Part* for the operation conducted. These requirements still need to be met and are not alleviated by the following preferred routes.
- 1.1.2 For any aircraft, single or multi-engine, which are unable to maintain height after an engine failure:-
- Flights through King Island- track via Cape Otway, Bold Head and Hunter Island. MNM ALT for continuous VHF COM - 3,000FT.
 - Flights through Flinders Island- landfall from/to Cape Liptrap through to McGauran Beach (MGBH) to track via Hogan Island, Deal Island then via Cape Portland or Waterhouse Island. MNM ALT for continuous VHF COM - 2,000FT.

1.2 Recommended VFR Reporting Procedures Across Bass Strait

- 1.2.1 The following reporting procedures are recommended for Bass Strait crossings.
- Report position leaving the coast, together with aircraft type, tracking details and POB;
 - Nominate reporting schedule appropriate to the aircraft speed e.g. 10, 15 or 30 minute intervals;
 - At each scheduled reporting time, report "OPERATIONS NORMAL", preferably with a position;
 - Report when crossing opposite coast to cancel the reporting schedules.
- 1.2.2 As an alternative, pilots may report leaving the coast and nominate a SARTIME for the expected landfall of the opposite coastline.

Note: All reports associated with these procedures for Bass Strait crossings should be made to Melbourne Centre as appropriate.

- 1.2.3 Minimum altitude requirements apply to enable continuous two-way VHF communication across Bass Strait.

1.3 Air Traffic Services

- 1.3.1 Air Traffic Services will respond immediately to any emergency call, but in the event of radio failure or other situation that prevents use of radio, the use of scheduled reporting over water will ensure that SAR action is taken following a missed report. A missed report ensures quicker response than a nominated SARTIME for which SAR action would be taken at the expiration of that time, or if incidental information was received indicating an aircraft was in difficulty.
- 1.3.2 In the unfortunate event of a ditching, particularly in Bass Strait, survivability from hypothermia is reliant on quick recovery from the water. Scheduled reporting will afford a quicker than normal response when SAR action is required.

2. SP 2 - FLIGHTS BETWEEN AUSTRALIA AND PAPUA NEW GUINEA

- 2.1 Pilots intending to fly to or from Papua New Guinea via Horn Island, must provide 24 hours notice to the Australian Customs Service. This notification should be directed to: Sub-Collector of Customs, Customs House, Victoria Parade, Thursday Island, Queensland. 4870. Telephone: 07 4069 1554 or fax: 4069 1211
- 2.2 Flights between Australia and Papua New Guinea are international flights. Pilots should refer to PNG AIP for relevant charts, frequencies and PNG entry requirements.
- 2.3 **Air Traffic Services And Flight Notification**
- 2.3.1 VFR flights proceeding from Australian to the Port Moresby FIR are required to submit flight notification in international format to Port Moresby ATS Units. Flight notification details submitted to Australian Briefing Offices will be forwarded to PNG authorities.
-

- 2.3.2 VFR aircraft operating outside Australian controlled airspace are not required to report to Australian ATS units prior to the FIR boundary, but may use reporting schedule (SKED) procedures while crossing Torres Strait. When exiting the Brisbane FIR for the Port Moresby FIR, pilots of VFR flights are responsible for establishing communications and their own SAR alerting requirements with Port Moresby FIC prior to crossing the common FIR boundary.
- 2.3.3 Radio communications with Port Moresby Flight Information Service (FIS) shall be established 15 minutes prior to the boundary estimate and the following details will be passed:
- aircraft registration
 - aircraft type
 - DEP AD/ATD
 - DEST AD/ETA
 - Altitude
 - EST FIR boundary
 - ETA next position
 - Persons On Board

Flight crew shall ensure aircraft are equipped with the mandatory frequencies of 5565, 6622, 8837, 8861 and 8906. Pilot to Pilot communications are available on VHF 128.95 (refer *PNG Aerodrome/Communications (AD/COM) Chart Dated 30 NOV 2004*)

3. SP 3 - TORRES STRAIT BIOSECURITY REQUIREMENTS

- 3.1 Several pests and diseases present in the Torres Strait and nearby Papua New Guinea are not found on mainland Australia. Consequently, biosecurity legislation controls the movement of goods such as fresh fruit and vegetables, meat and meat products, live plants, seeds and plant materials, live animals, hides, skins and soil, south from the “Torres Strait Protected Zone” (northern islands) to the “Permanent Biosecurity Monitoring Zone” (Thursday Island group), or from either of these two zones to the mainland.
- 3.2 Movement of these goods is restricted by the Department of Agriculture and Water, and the Environment (the department). A permit is required for certain goods.
- 3.3 Pilots should ensure that an aircraft travelling south from either of these zones to the mainland are suitably disinfected.
- 3.4 Pilots must ensure they notify the department before departing to the Australian mainland. Pilots must attempt to contact biosecurity staff at the island departure point. This can be done 30 minutes prior to departure from the Torres Strait. A biosecurity officer may inspect your aircraft and goods carried by crew or passengers. A *notification number* will be issued by a biosecurity officer, which pilots should record for auditing purposes. If there is no biosecurity officer available on their island of departure, pilots must contact the Department 30 minutes prior to arrival on the mainland by contacting the department officers at Horn Island Airport on 07 4069 1310 or the Thursday Island Office on 07 4212 0185.

4. SP 4 - PURNULULU NATIONAL PARK (BUNGLE BUNGLE) SCENIC FLIGHTS

- 4.1 Scenic flights conform to the route depicted on the following Fixed wing and Rotary wing map and to the Standard Operating Procedures. Pilots conducting these flights should operate on 127.3.
- 4.2 **National Park Entry Points**
- NE Entry 1718.3S 12830.7E
 - SW Entry 1728.0S 12817.5E
- 4.3 **Aeroplanes**
- 4.3.1 Aeroplanes operate around the Bungles in a clockwise direction and in accordance with the following procedures:
- a. Scenic route entry and exit should be conducted via the designated points.
 - b. Entry and Exit of route at other locations must be at a tangent to the route.
 - c. Corner cutting and orbits are not permitted.
 - d. The maximum IAS is 140KTS.
 - e. Operate between 2,500FT and 3,000FT.
-

- f. Broadcast departing the area on the CTAF 127.3.
 - g. Traffic departing the Route at the Bellburn exit point for landing at Bellburn to maintain a track 2NM East of the Coalition.
- 4.3.2 Bellburn is a private strip and permission is required prior to landing. Refer to Bellburn FAC entry for contact details.
- 4.3.3 Visiting Aircraft/Pilots. Due to high volume of both Fixed wing and Rotary wing traffic at the Bungles:
- a. It is highly recommended that a briefing is obtained from any of the local scenic operators at Kununurra before conducting a scenic flight of the Bungle Bungles. If no briefing is available, pilots/aircraft should maintain 3,500FT over the Bungle Bungles.
 - b. Peak traffic times are 06:30-07:30, 09:30-10:30 and 15:30-16:30 Local, try and avoid these times where possible.

Purnululu National Park - Suggested Aeroplane Routes

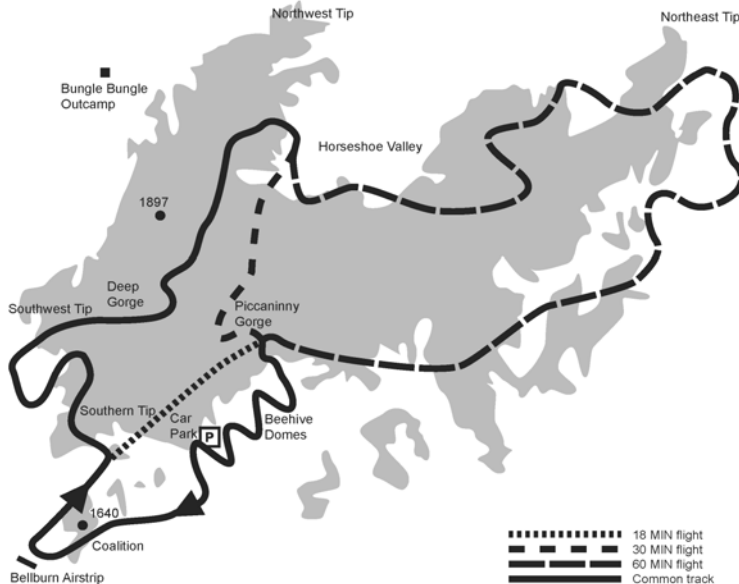

4.4 Helicopters:

- 4.4.1 Helicopters are requested to respect public and indigenous sensitivities by following the negotiated flight paths within the Bungle Bungles (Purnululu National Park).
- 4.4.2 To maintain terrain clearance, helicopters may operate to the minimum extent required above 2,000FT provided they:
 - a. Broadcast their intentions before leaving 2,000FT on climb;
 - b. Cross the aeroplane route at right angles; and
 - c. Broadcast returning to operations not above 2,000FT.
- 4.4.3 Helicopters are not permitted to land on the Bungle Bungle Range at any time. Helicopters can only land at the Bellburn airstrip within the Purnululu National Park.

- 4.4.4 Bellburn is a private strip, permission is required prior to landing. Refer to *Bellburn FAC* entry for contact details.
- 4.4.5 Visiting Helicopters/Pilots. Due to high volume of both Fixed wing and Rotary wing traffic at the Bungles; It is highly recommended that a briefing is obtained from any of the local Helicopter scenic operators at Kununurra or Bellburn before conducting a scenic flight of the Bungle Bungles.

5. SP 5 - GREAT SANDY BAY MARINE PARK AND FRASER ISLAND

- 5.1 In the whale management area of the Great Sandy Marine Park, pilots of fixed wing ACFT must not bring the ACFT any closer to a whale than 300M unless the aircraft is at an altitude of at least 1,000FT. A helicopter must not be brought any closer to a whale than 1KM unless the helicopter is at an altitude of at least 2,000FT. For further information refer to the Marine Park (Great Sandy) Zoning Plan 2006 or contact the Queensland Parks and Wildlife Service, Senior Ranger (Great Sandy Marine Park) on phone: 07 4197 4003. For information relating to flights over the Great Sandy National Park (Fraser Island section) contact the Conservation Officer (Fraser Island) on phone: 07 4127 9128 (ext 223).

6. SP 6 - FRUIT FLY EXCLUSION AREA

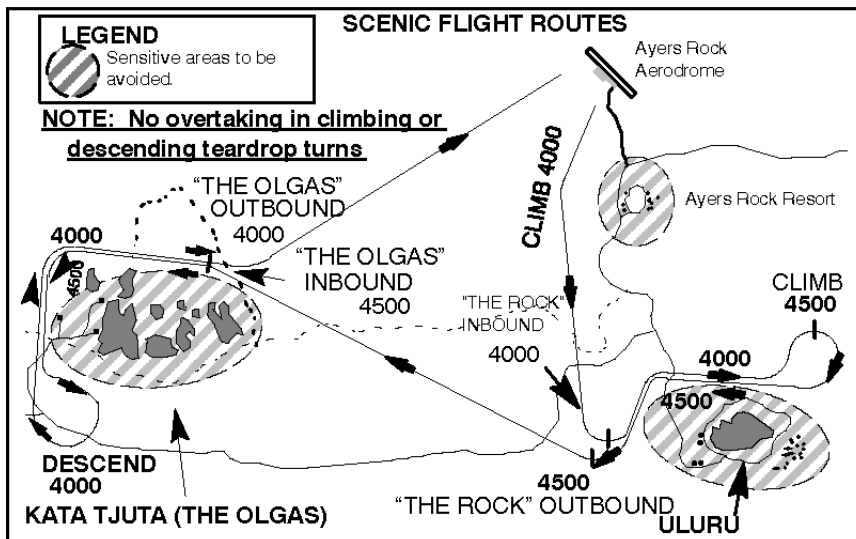

- 6.1 Pilots should be aware that carrying fresh fruit into the Fruit Fly Exclusion Zone without a permit is illegal.

7. SP 7 - AYERS ROCK

7.1 STANDARD SCENIC FLIGHT PROCEDURES

- 7.1.1 Except in an emergency, no aircraft is permitted to land in the Uluru-Kata Tjuta National Park (The Park). The Park covers an area of approximately 406 square NM. Irregular shaped in profile, the park is bounded by straight lines joining 2524.54S 13122.19E, 2515.47S 13100.34E, 2515.54S 13100.34E, 2515.55S 13045.40E, 2507.19S 13045.10E, 2504.48S 13040.40E, 2524.54S 13040.40E, 2524.54S 13122.19E (GDA94 data format).
- 7.1.2 All commercial activity, including aviation, within or over the Park requires a permit from the Park's Director. Permits routinely take 28 days to be processed. Hang gliding, parachuting and ballooning are generally not allowed from or over the Park. Further information is available from the Park's website: www.environment.gov.au/parks/uluru/index.html.
- 7.1.3 Due to the cultural significance to the traditional owners of areas within the Park, Special Procedure 7 (SP7) was developed by Park management and the resident aircraft operators for scenic flights around Uluru (Ayers Rock) and Kata Tjuta (the Olgas). SP7 (the Standard Scenic Flight Procedure) describes the route to be flown.
- 7.1.4 Pilots operating scenic flights around Uluru (Ayers Rock) and Kata Tjuta (the Olgas) are requested to follow the flight path depicted on the diagram below and set out in subparagraphs 7.4.1 to 7.4.3. To avoid confusion, pilots are requested to refer to the aerodrome as 'Ayers Rock' or 'Ayers Rock aerodrome' and to Uluru (Ayers Rock) as 'the Rock'. More detailed information is available from the Uluru/Ayers Rock inset of the Alice Springs Visual Terminal Chart (VTC).

7.1.4.1 Flight directly over the Rock or the Olgas is to be avoided. Additionally, flight over the sensitive areas marked on the diagram is to be avoided.

7.1.4.2 Fixed wing aircraft should:

- track Ayers Rock AD to the Rock at 4,000FT;
- climb to 4,500FT NE of the Rock (see diagram);
- track the Rock to the Olgas at 4,500FT;
- descend to 4,000FT SW of the Olgas (see diagram)
- track the Olgas to Ayers Rock AD at 4,000FT.

7.1.4.3 Helicopters should track via the same route as fixed wing aircraft, but maintain 3,500FT for the entire flight.

7.1.5 Pilots should note that a CA/GRS operates at Ayers Rock AD. All aircraft are requested to make the following broadcasts:

- prior to taxiing, aircraft details and RWY;
- 'departed Ayers Rock aerodrome for the Rock climbing to (level)';
- 'the Rock inbound (level)' (at the gate depicted on the diagram);
- if applicable 'leaving 4,000FT for 4,500FT';
- at the gate depicted on the diagram, 'the Rock outbound (level)';
- at the gate depicted on the diagram, 'the Olgas inbound (level)';
- if applicable 'leaving 4,500FT for 4,000FT';
- at the gate depicted on the diagram, 'departing the Olgas (level) for Ayers Rock aerodrome runway (13/31)'; and
- for all other broadcasts, standard non-controlled aerodrome operating and communication procedures apply.

7.1.5.1 For all other flights within the Ayers Rock aerodrome (YAYE) designated broadcast area, standard non-controlled aerodrome procedures apply.

8. SP 8 - HELICOPTER OPS IN SA QUARANTINE AREA

8.1 The South Australian Department of Water, Land and Biodiversity Conservation (DWLBC) has declared a quarantine area located east of Murray Bridge Aerodrome (350400S 1391336E) to assist in preventing the spread of a noxious weed - Branched Broomrape.

8.2 The quarantine area is about 35NM square (see diagram), within the bounds 3441.4S 13915.2E, 3441.4S 13957.8E, 3516.5S 13957.8E, 3516.5S 13915.2E, 3441.4S 13915.2E.

- 8.3 The DWLBC has advised that the seed is spread mostly by personal footwear, including socks. Consequently, a decontamination service has been established for those who enter the quarantine area to use prior to departure.
- 8.4 For specialist advice, pilots of helicopter aircraft operating into the area should contact the DWLBC on 1800 245 704 (available 0700 - 2100 local daily) before planning to land in the area, or before moving the aircraft if an unplanned landing has occurred.

9. SP 9 - TASMANIAN QUARANTINE REQUIREMENTS

- 9.1 Tasmania has strict Quarantine regulations, backed up by strong penalties for breaking the law. Tasmania is relatively free from a range of pests and diseases found in other parts of Australia and the regulations are an important measure to minimise the risk to Tasmania's environment and important agricultural industries.
- 9.2 To meet Quarantine regulations, you must declare fresh fruit, vegetables, plants and plant products and fish and fish products to a Quarantine Officer. Otherwise, you should dispose of these items in the quarantine bins located in the arrival area.
- 9.3 Quarantine restrictions also apply to the importation of all plant cuttings, seeds, cut flowers, native birds, reptiles, aquarium fish, fishing gear, waders and animal products such as fox skins and hides. Dogs will need to be treated for the Hydatid Tapeworm and proof shown to Quarantine upon arrival in Tasmania.

- 9.4 Quarantine measures are important. If you do, by mistake, bring any restricted items into Tasmania, pass them to the quarantine officer at the barrier checkpoint for inspection or dispose of them in the bins provided. If you pass the checkpoint, quarantine officers or trained sniffer dogs may detect these items and you could receive an on the spot fine.
- 9.5 If you are unsure about any goods or material you are carrying then please check with the quarantine officer on duty, contact Quarantine Tasmania or visit the website. Quarantine Tasmania can be contacted on the following:
Email: quarantine.enquiries@dpiwve.tas.gov.au
Website: www.dpiwve.tas.gov.au/quarantine
Phone: 03 6233 3352
- 10. SP 10 - KATI THANDA - LAKE EYRE NATIONAL PARK**
- 10.1 Kati Thanda - Lake Eyre National Park is administered by the Department of Environment, Water and Natural Resources (DEWNR), in accordance with the National Parks and Wildlife Act 1972. The region includes a number of sensitive areas that can, in times of lake flooding, contain large bird populations of environmental significance.
- 10.2 Pilots are reminded that the bird populations can appear at short notice and locations can change rapidly. This can be hazardous to aviation. Pilots are requested to keep a lookout for bird populations (airborne or nesting) and remain above 1,500FT AGL and outside a 1NM perimeter of these areas. For further details contact Natural Resources South Australian Arid Lands on 08 8648 5300 or email SAAridlands@sa.gov.au.
- 10.3 During periods when water is present in Lake Eyre, increased sightseeing traffic can be expected. Regular departures occur from airstrips within the broadcast area and larger capacity aircraft can be expected to be operating to a minimum of 1500FT AGL.
- 10.4 The following procedures are recommended when operating in the area:
- (i) Communications within the Lake Eyre Broadcast Area (BA) SFC to 5,000FT should be on FREQ 127.8.
 - (ii) Broadcasts should be made whenever reasonably necessary to avoid a collision, or the risk of collision, with another ACFT.
 - (iii) Pilots should consider making and information call on entering the BA at or below 5,000FT - reporting the ACFT's position by reference to ALA's within the BA or as a bearing and distance from Lake Eyre North or Lake Eyre South. It is recommended that pilots make a broadcast when over significant features as depicted on the WAC.
 - (iv) It is highly recommended that a briefing is obtained from any of the local commercial scenic operators in the area to determine the traffic pattern in use and areas of increased traffic concentration. These include but are not limited to, Belt Bay and the Warburton and Cooper Creek inlets. Contact Wrightsair on 08 8670 7962 or email wrightsair@bigpond.com.
 - (v) Lake Eyre scenic routes can vary (seasonal water levels, concentrations of wildlife, etc), however a clockwise direction is recommended. Commercial scenic operations take place between 1,500FT and 3,500FT but may be conducted at any level in the BA depending on the nature of the operation.
 - (vi) Traffic climbing or descending through the 5,000FT upper limit should broadcast intentions on the appropriate FREQ.
 - (vii) Except in an emergency or with prior permission from the DEWNR, landing on Lake Eyre or anywhere within the Kati Thanda Lake Eyre National Park is prohibited. Do not attempt to land on Lake Eyre as the SFC may not support the weight of your ACFT.
- 10.5 Prior permission is required if landing at any of the airstrips with the BA, CTAF 127.8.
- 10.6 Refer to ERSA FAC entry for YWMC and YMRE.
- 10.7 The BA is depicted on ERCL 7 and is within the boundaries of straight lines joining 2730S 13600E to 2730S 13900E to 3000S 13700E to 3000S 13600E to 2730S 13600E.

11. SP 11 - GREAT BARRIER REEF - CAIRNS SCENIC FLIGHTS

11.1 High volume helicopter and fixed wing traffic operate over an area of the Great Barrier Reef 18NM north east of Cairns Airport, encompassing Green Island, Arlington Reef, Hastings Reef and Upolu Cay. While the aircraft operate on various tracks the general traffic flow shall be anti-clockwise.

11.2 **Entry/Exit**

- a. Entry gate: **Green Island.**
- b. Anti-clockwise traffic flow.
- c. Exit gate: **Upolu Cay.**
- d. Entry/exit gates will remain unchanged regardless of the active runway-in-use at Cairns Airport.

11.3 **Rotary Wing Tracks**

- a. Track outbound at 500FT to **Green Island** – remain at 500FT until 12DME from Cairns Airport then climb to 1,000FT.
- b. Track inbound at 500FT from **Upolu Cay.**
- c. Rotary wing aircraft to broadcast on the CTAF before operating in the reef scenic area above 500FT.

11.4 Fixed Wing Tracks

- a. Track outbound at 1,500FT to **Green Island**.
- b. Track inbound at 1,000FT from **Upolu Cay** to **Gate A**.
 - (i) **Gate A** location is at 1643S 14552E on the **Upolu** to **Yorkeys Knob** track.
- c. For arrivals to **Runway 15**: track as cleared and directed by ATC.
- d. For arrivals to **Runway 33**: from exit **Gate A** turn left and track towards **Cape Grafton**, remaining OCTA at 1,000FT.
- e. Fixed wing aircraft to broadcast on the CTAF before operating in the reef scenic area below 1,000FT.

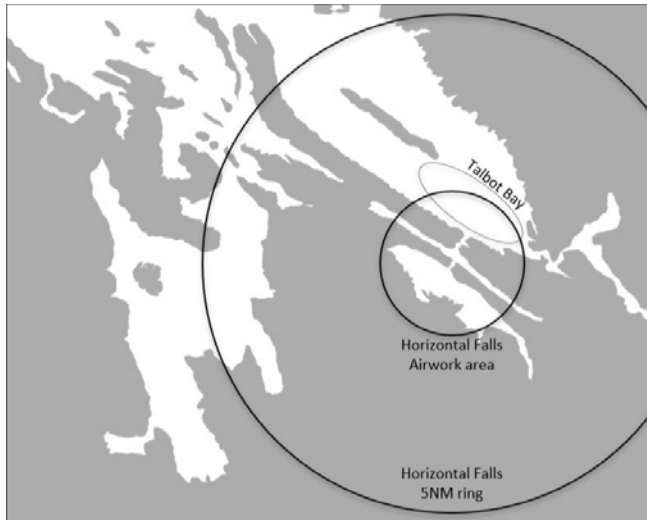

*Note 1: When Runway 33 is in operation at Cairns Airport, outbound traffic can expect fixed wing aircraft to track south from **Gate A** toward **Cape Grafton** at 1,000FT.*

*Note 2: For heightened situation awareness, all traffic should be monitoring **FREQ 126.1** between 7NM and 12NM from Cairns Airport.*

12. SP 12 - HORIZONTAL FALLS SCENIC FLIGHTS

- 12.1 Seaplanes and helicopters operate at 2,000FT and below at the Horizontal Falls, landing and departing the Talbot Bay area as depicted in the image below.
- 12.2 A 2,500FT lower level for fixed wing aircraft (excluding seaplanes) exists during seaplane operations to facilitate operations into Talbot Bay. If seaplanes are not in operation and passengers are wearing life jackets if required, operations at 2,000FT for fixed wing aircraft may be conducted.
- 12.3 Low level helicopter operations are conducted at the Horizontal Falls below 1,000FT.
- 12.4 An area briefing for itinerant aircraft is advised from local operators (primarily based at Broome) before conducting operations at the Horizontal Falls.
- 12.5 Scenic flights for all fixed wing and rotary aircraft should operate in accordance with the following procedures:
 - a. At 10NM, aircraft are to broadcast airwork intentions on the West Kimberley Broadcast Area CTAF 127.2.
 - b. Traffic to be separated by 500FT increments. If the desired altitude for airwork is unavailable, holding outside of the Horizontal Falls 5NM radius is required until the desired altitude is available.
 - c. At 5NM inbound to the Horizontal Falls, aircraft must be established at the desired airwork altitude and broadcast location, inbound heading and intentions.
 - d. Outbound from the Horizontal Falls, aircraft should not climb from their airwork altitude until outside the 5NM radius and established on their outbound track.
 - e. Seaplane operations to remain at 1,500FT (clear of terrain) until passing the 5NM radius from the Horizontal Falls.

13. SP 13 - WILPENA POUND

- 13.1 Wilpena Pound is situated in the central Flinders Ranges of South Australia and at the centre of the Wilpena Broadcast Area depicted on En Route Chart (ERC L7). The Broadcast Area extends from Hawker in the south to Blinman in the north.
- 13.2 Prior permission is required to land at Wilpena (YWPN) operated by Ikara Wilpena Pound Resort and Rawnsley Park (YRYK) and at most of the other airfields in the Broadcast Area.
- 13.3 Communications within the Broadcast Area SFC to 5,000FT should be on FREQ 126.7
- 13.4 Pilots of visiting aircraft should consider making an information call on entering the Broadcast Area at or below 5,000FT, reporting position and intentions by reference to significant features as depicted on the WAC.
- 13.5 Traffic climbing or descending through the 5,000FT upper limit should broadcast intentions on the appropriate FREQ.
- 13.6 Broadcasts should be made whenever reasonably necessary to avoid a collision, or the risk of collision, with another ACFT.
- 13.7 Commercial fixed wing and helicopter flights operate a variety of scenic flight routes in the vicinity of Wilpena Pound on a regular basis. Most flights are conducted not above 4,500FT but altitudes vary due to weather conditions.
- 13.8 Commercial operators report over a number of points in the vicinity of Wilpena Pound. The map below depicts these points, some of which are not depicted on the WAC.
- 13.9 Prior to operating in the vicinity of Wilpena Pound it is highly recommended that pilots obtain a briefing from one of the local operators to determine the traffic pattern in use.

13.10 Wilpena Pound Special Procedures

- a. Special Procedures are recommended in the vicinity of Wilpena Pound to separate visiting aircraft from local commercial traffic.
- b. To minimise conflict with commercial scenic flights, where possible visiting aircraft planning to fly in the vicinity of Wilpena Pound should consider operating in accordance with the following:
 - (i) Not below 5,000FT.
 - (ii) Track to enter over either Mount Hayward in the north or Rawnsley Park in the south.

31. FN 18 - FREYCINET PENINSULA, TASMANIA - Fly Neighbourly Advice**Areas Affected by the Fly Neighbourly Advice (FNA)****31.1 The Reserves**

Administered by the Tasmanian Government's Parks and Wildlife Service (PWS), the area includes Freycinet National Park, Coles Bay Conservation Area and Moulting Lagoon Game Reserve. Apsley Marshes which adjoins the Moulting Lagoon Game Reserve is private property.

31.2 Ramsar Sites

Moulting Lagoon Game Reserve and Apsley Marshes are both designated Ramsar sites.

31.3 Sensitive Environmental Areas (SEA) associated with The Reserves and Ramsar Sites.

There are many SEA due to the presence of wedge-tailed eagle and white-bellied sea-eagle nest sites, seabird, shorebird and water fowl breeding, feeding and roosting sites as well as seal haul-out areas.

31.4 Preferred Altitudes and Operation

The preferred minimum over-flight altitude for the Reserves and the Ramsar sites is 1,500FT above the ground or water. The recommended over-flight altitude of the SEA (at the centre of the SEA) is 3,000FT above ground or water. See the PWS website for details. It is preferred that aircraft operate off-shore as much as possible, at the highest possible altitude and greatest lateral distance from features of scenic interest.

31.5 Landing

Except in an emergency, no flight is permitted to land at any location within:

- a. the Reserves without approval from the PWS; or
- b. the Apsley Marshes Ramsar site without approval of the land owner.

Further information is available in the full version of the FNA on the PWS website. All pilots operating in the affected areas are requested to adhere with the FNA.

32. FN 19 - INNES NATIONAL PARK AND ALTHORPE ISLANDS CONSERVATION PARK, SOUTH AUSTRALIA

Areas Affected by the Fly Neighbourly Advice (FNA)

32.1 Innes National Park and Althorpe Islands Conservation Park

Administered by the Department of Environment, Water and Natural Resources (DEWNR), the FNA includes three areas for the protection of endangered White-bellied Sea Eagle and Eastern Osprey.

- a. Pondalowie Bay: Royston Head to West Cape.
- b. The Gap: Ethel Beach, along the coast and extending to Haystack and Seal Islands.
- c. Althorpe Island: Althorpe Island and surrounding islands.

32.2 Preferred Altitudes and Operation, from 1 June to 31 December

- a. The preferred minimum over-flight altitude is 2,000FT above ground level. However, altitudes less than 5,000FT may have a detrimental effect on endangered seabirds.
- b. Maintain constant RPM/pitch (avoiding sudden changes in engine management).
- c. Aerial operations should be kept to a minimum and be operated at an altitude and configuration that will minimise noise and visual impact for ground observers.
- d. Avoid hovering and repeat passes or circuits.

32.3 Landing

Landing is restricted on DEWNR land within the Yorke District under the *National Parks and Wildlife Act 1972* and *National Parks and Wildlife (National Parks) Regulations 2016*.

32.4 All pilots operating in the affected areas are requested to adhere with the FNA.

Further information is available in the full version of the FNA on the DEWNR website, or by contacting the Yorke District Office.

33. FN 20 - KANGAROO ISLAND

Areas Affected by the Fly Neighbourly Advice (FNA)

33.1 Kangaroo Island

Lands administered by the Department of Environment, Water and Natural Resources (DEWNR) include:

- Wilderness Protection Areas (not forming part of this FNA except where overlain by a Sensitive Avoidance Area);
- National and Conservation Parks;
- Crown Lands (includes most of the coastal strip of Kangaroo Island) where not vested in the control of others.

Extending over some lands managed by DEWNR (and "connecting" areas of freehold) and the adjoining areas of sea, are six Sensitive Avoidance Areas (SAAs) (refer to the map).

SAAs are principally for the protection of the birds (e.g. nesting areas for cliff dwelling raptors especially the endangered White-bellied Sea Eagle and Eastern Osprey); shorebirds (e.g. Fairy Terns); waterbirds and seals (especially haul out and breeding areas for the endangered Australia Sea-lion). They are labelled on the map (where geographical coordinates are also provided) as:

- Cape Gantheaume coast from Point Tinline southwest to Cape Gantheaume.
- Seal Bay coast from Bales Bay to the park boundary west of Nobby Island.
- Vivonne Bay Conservation Park coast.

D. Coast from South West River at Hanson Bay then westerly through Cape Younghusband, Remarkable Rocks, Cape du Couedic, then southwest to Casuarina Islets (The Brothers).

E. Paisley Islet near West Bay.

F. Coast from Cape Borda east to the eastern boundary of the Western River Wilderness Protection Area.

33.2 **Preferred Altitudes (all year round)**

National and Conservation Parks:

The preferred minimum altitude is 1,500FT AGL.

Sensitive Avoidance Areas:

The preferred minimum altitude is 2,000FT AGL.

The preferred minimum lateral distance at the SAAs is 600M from the coastline (both inland and seaward).

33.3 **Landing**

Landing is restricted on DEWNR land within the Kangaroo Island Region pursuant to the *National Parks and Wildlife Act 1972* and *National Parks and Wildlife (National Parks) Regulations 2016*. This does not apply to emergency situations.

33.4 All pilots operating in the affected areas are requested to adhere with the FNA.

Further information is available in the full version of the FNA on the DEWNR website.

34.1 **Symbio Wildlife Park**

The SWP contains a wide range of native and exotic animal species including Tasmanian Devils, Cassowarys, Dingos, Sumatran Tigers, Red Pandas and Pygmy Marmosets, and there is a need to minimise stress induced by aircraft noise.

34.2 FNA Location

The FNA is a 0.5NM radius circle centred on 3412.5S 15058.0E.

34.3 Preferred Altitudes and Operations

- a. Avoid hovering and repeat passes or orbits.
- b. The preferred over-flight altitude is 2,500FT AMSL.
- c. Maintain constant RPM/pitch (avoiding sudden changes in engine management).

34.4 All pilots operating in the affected areas are requested to adhere with the FNA.

35. FN 22 - NAVY WARSHIPS - Fly Neighbourly Advice**35.1 Australian and foreign warships often have embarked ACFT which may conduct aviation operations at any time.****35.2 In order to maintain safe operations, pilots operating in Class G airspace should avoid warships by 5NM laterally or not below 2,000FT vertically whenever possible, and should not circle the warship at any time.****35.3 Traffic alerts and warnings may be passed on FREQ 121.5MHz to ACFT operating in the vicinity of warships.****36. FN 23 - TASMAN NATIONAL PARK, TASMANIA**

Area affected by the Fly Neighbourly Advice (FNA)

36.1 Tasman National Park

A Fly Neighbourly protection area has been established in the southern section of the Tasman National Park to provide some protection to vulnerable natural values (e.g. eagles and seals), experiences of visitors and nearby residents. The Tasmania Parks and Wildlife Service (PWS) manages the Tasman National Park.

36.2 The FN applies to:

- a. the southern sections of the Tasman National Park south of a line that extends west from the Hippolyte Rocks to Bivouac Bay, and to the northern end of White Beach and Wedge Island; and
- b. includes the Three Capes Track.

36.3 Preferred Operations

All pilots operating in the area are requested to adhere to the FN.

a. Sensitive Environmental Areas (SEA):

- (i) avoid eagle nests by a 3,000FT (1,000M) buffer during eagle breeding season, and do not hover over eagle nests at any time of the year;
- (ii) avoid important seal habitat by a 1,650FT (500M) buffer; and
- (iii) only fly in the vicinity of important burrowing seabird habitat during daylight hours, and avoid the Hippolyte Rock area at all times of the day and night.

b. The preferred minimum overflight altitude for the Tasman National Park is 1,650FT (500M) above ground or water.**c. It is preferred that aircraft operate offshore as much as possible, at the highest possible altitude and greatest lateral distance, from features of scenic interest.****d. Avoid hovering and repeat passes or orbits, especially near the Three Capes Track and offshore islands.****e. Maintain constant RPM/pitch (avoid sudden changes in engine management, which can startle or disturb wildlife).****36.4 Landings**

Except in an emergency, aircraft are not permitted to land at any location within the Tasman National Park without written approval from the PWS.

37. FN 24 - AERIAL FIREFIGHTING ASSOCIATED WITH BUSHFIRES - Fly Neighbourly Advice

- 37.1 Bushfires may occur at any time and may require unnotified intensive aviation activity associated with aerial firefighting.
- 37.2 Operations may occur within 5NM radius and below 3,000FT AGL of observed fires.
- 37.3 In order to maintain safe operations, all pilots of manned and unmanned aircraft should avoid active bushfires where firefighting may be in operation.
- 37.4 Coordination through active bushfire affected areas should be arranged with the relevant State fire authority.

FIS: IN FLIGHT INFORMATION SERVICES

1. AUTOMATIC BROADCAST SERVICES

1.1 AWIS locations not listed in ERSA-FAC

Location	State	Frequency	Phone
Batchelor	NT		08 7922 2501
Kilmore Gap	VIC	128.6	03 8470 3210
Moss Vale	NSW		02 9353 6437
Mount Boyce	NSW		02 9353 6438
Murrurundi Gap	NSW		02 9353 6440
Samuel Hill	QLD		07 3564 3736
Tarcoola	SA		08 8150 3818

2. ON-REQUEST IN-FLIGHT INFORMATION SERVICE

- 2.1 Pilots should ensure they pre-fix any request for FIS on VHF with the call sign "FLIGHTWATCH". When operating on HF also include the frequency, for example: "FLIGHTWATCH, ROMEO JULIET DELTA, SIX FIVE SIX FIVE, REQUEST ACTUAL WEATHER Halls Creek"

Note: This helps to identify the service required and your location.

- 2.2 Requests will be dealt with on a "first come-first served" basis.
- 2.3 Pilots should be mindful that flight information services provided on HF by the FIS may be delayed while communications for traffic information services are being relayed between air traffic control and pilots of IFR flights.

3. HAZARD ALERTS

- 3.1 Hazard Alerts contain information, assessed by ATS to have an immediate and detrimental effect on the safety of an aircraft, that could assist pilots to avoid hazardous situations. Hazard Alerts will be:
- broadcast on the appropriate ATS FREQ as necessary. Broadcasts will normally be made on receipt, H + 15 and H + 45 or until the availability of an updated FIS product (MET or NOTAM) has been broadcast; and
 - directed to those aircraft maintaining continuous communications with ATS at the time the hazard is assessed that are within one hour flight time of the hazardous conditions.

4. CANCELLATION OF SARWATCH (FULL REPORTING)

- 4.1 The preferred method for pilots using full reporting procedures to cancel SARWATCH is via radio. When two way radio communications are not available, pilots wishing to cancel SARWATCH may do so by telephoning the appropriate ATC Centre:
Brisbane ATC Centre 07 3866 3868^
Melbourne ATC Centre 03 9235 2039^.

5. CANCELLATION OF SARTIME

- 5.1 Except when a SARTIME for Departure has been nominated to ATC for an intermediate arrival and departure, all SARTIMEs nominated to Airservices will be held by CENSAR. For those SARTIMEs that will be held by CENSAR, pilots must show CENSAR as the unit responsible for a location when submitting flight notifications.
- 5.2 The preferred method to cancel a SARTIME is via telephone to CENSAR on 1800 814 931^. When telephone facilities are not available you may use ATS frequencies.
- 5.3 Pilots are encouraged to nominate a suitable time period for a SARTIME that will provide sufficient time for the flight to take place and to reach suitable facilities for cancellation in the event that radio contact is not available.

- 5.4 Whenever possible a single SARTIME should be nominated to encompass a number of flights that have short time intervals, rather than nominating a SARTIME for each flight stage. Nomination should be by flight notification direct to the FIS and CENSAR.

6. SAFETY RELATED MATTERS

- 6.1 Telephone services may be used to contact Australian ATS units or the Joint Rescue Coordination Centre (JRCC) Australia, as appropriate, for urgent, non-routine and safety-related matters. Telephone numbers are listed below:

Airservices Australia	
Brisbane ATC Centre	07 3866 3868^
Melbourne ATC Centre	03 9338 4032^
Perth ATC Centre	08 9476 8545^
Sydney ATC Centre	02 9556 6875^
Joint Rescue Coordination Centre (JRCC) Australia	
SAR Hotline (within Australia)	1800 815 257
SAR Hotline (outside Australia)	+61 2 6230 6899

7. UPDATE OF SPFIB/AVFAX PRODUCTS

- 7.1 Pilots in receipt of NAIPS SPFIB or AVFAX briefings may quote the briefing identification number from the top of the first page of the briefing to obtain an update to the NOTAM and the latest MET INFO when airborne, through FLIGHTWATCH. The number is available from the first page of the briefing text. This will ensure that only the route, area and location NOTAM held are updated and will avoid repetition. For example - "FLIGHTWATCH, ALPHA BRAVO CHARLIE, REQUEST UPDATE ON SPFIB (OR AVFAX) BRIEFING NUMBER NINER ZERO ZERO ZERO ONE (90001)."

8. FAILURE OF GROUND STATION EQUIPMENT

- 8.1 In the unlikely event of failure of groundstation SSB equipment an alternative SSB FREQ should normally be available to ensure that ACFT are provided with HF communications.

9. FLIGHTWATCH HF ORGANISATION

FREQUENCIES

NORTH WESTERN	3452	6541	8843	SP-6	BRISBANE INTL	3467	5643	8867	13261	17904	(KHZ)
NORTH EASTERN	3452	6610	8831	SEA-3	BRISBANE INTL	3470	6556	11396	13318	17907	(KHZ)
SOUTHERN	3461	6565	8822	INO-1	BRISBANE INTL	3476	5634	8679	13306	17961	(KHZ)

- 9.1 Australia is divided into six HF Network Areas known as Regional Domestic Air Route Areas (RDARA). Details of the HF FREQ organisation is shown on PCA. All FREQ quoted are suppressed carrier FREQ, and the upper sideband mode is used. These HF FREQ are operated from Brisbane.
- 9.2 Depending on HF propagation conditions, the best useable RDARA/MWARA frequencies for reception will vary. Pilots can access up to date primary and secondary frequencies for all Domestic and International HF through the Aircservices website. Access is made through Pilot Briefing Services, Location Briefing. Each HF area has been allocated a unique code and once entered into Location Briefing will provide an up to date primary and secondary HF frequency for that selected area. Enter the code that represents the area required in the following table.

RDARA	LOCATION CODE
Southern	165
North Western	170
North Eastern	175
MWARA	
SP-6 Brisbane INTL	150
INO-1 Brisbane INTL	155
SEA-3 Brisbane INTL	160

10. ATS AREA FREQUENCIES AT UNCONTROLLED AERODROMES

- 10.1 These are shown on en route and terminal charts.
- 10.2 HF facilities are remotely operated; proximity to these may affect frequency selection. The location of HF outlets and the frequencies operated from each outlets are shown above.

11. LOW JET ROUTES

- 11.1 Routes at or below 5,000FT AGL used by military aircraft for low level, high speed operations are designated as Low Jet Routes (LJR). Routes are planned to avoid:
- controlled airspace administered by Airservices Australia;
 - restricted and danger areas not administered by the ADF;
 - civil aerodromes listed in ERSA by at least 5NM laterally or 4,000FT vertically;
 - aerodromes where carriage and use of radio is required unless equipped with the appropriate radio frequency; and
 - sensitive areas and oil/gas platforms as detailed in ERSA.
- 11.2 Notification of routes and duration of LJR operations will be by NOTAM. Information on LJR activity in your area is available from the pre-flight briefing service and FLIGHTWATCH.
- 11.3 Aircraft using LJR may be camouflaged and emit little or no smoke trail, although they will normally show anti-collision beacons. They may operate singly or in close or loose formation. Significant wake turbulence and a large turn radius may be expected.
- 11.4 All LJR aircraft are equipped with UHF and some also have VHF and HF. However, they may often be out of communications (NOCOM) for part of their flight. Although most LJR aircraft are radar equipped, these radars do not enable avoidance of conflicting aircraft.
- 11.5 WHERE POSSIBLE, PILOTS SHOULD PLAN THEIR FLIGHTS TO AVOID ACTIVE LJR.
- 11.6 The following LJR are activated HJ and are flown by F18 aircraft operating at or BLW 5,000FT AGL:
- R638 - 10NM SSW Baryulgil below 3,000FT AGL - Gatton (Climb Point) - Amberley.
 - R638 - Coastal below 3,000FT AGL - Gold Coast - Point Lookout (Stradbroke Island) - Brisbane.
 - Point Lookout - Gold Coast- Coastal below 5,000FT AGL - R638.
 - R638 - Casino 231025 - Amberley 191043 - Amberley.
 - Sandy Cape - Coastal below 3,000FT AGL - Double Island Point - Bribie Island - Cape Moreton - Point Lookout.
 - Point Lookout - Cape Moreton - Bribie Island - Coastal below 3,000FT AGL - Double Island Point - Sandy Cape.

Note: A number of other LJR and Defence activities are in operation at various times in addition to those shown above and will be advised by NOTAM when necessary.

12. NIGHT VISION DEVICES AND EQUIPMENT

- 12.1 Night vision devices and equipment are used in defence, security and law enforcement operations. Current equipment is:
- Night Vision Goggles (NVG) - helmet mounted light amplifying binoculars which sense minute amounts of visible and near infra red light under conditions of near darkness and enhance them through an image intensifier tube assembly.
 - Low Light Television (LLTV) - aircraft equipment which uses TV cameras with powerful zoom lenses, with or without image intensifiers for low light conditions.
 - Forward Looking Infra Red (FLIR) - aircraft mounted sensor which detects temperature differences and displays on a screen, thermal images. May also be capable of looking along other axes. Used in SAR, law enforcement and defence applications.
- 12.2 Various limitations are placed on the aircraft and crews using these devices. In particular, NVG require modifications to aircraft lighting. Masking or extinguishing external lights may create difficulties for other traffic and ATC in providing visual separation, particularly since most of the defence aircraft involved are camouflaged. Much of this activity is carried out at low level and may involve abrupt manoeuvring.
- ## 13. LOW LEVEL FLIGHTS - NOTIFICATION
- 13.1 Flights at very low level will advise their operating band of levels in the flight notification. Aircraft unlit, or with masked external lights will advise their operating area. In controlled airspace, other traffic will be advised of the activity and separation will be achieved using local procedures agreed between ATS and the night vision device user. In Class G airspace, notification of low level flights will be provided by NOTAM.

14. PRECAUTIONS

- 14.1 Because of the likely activities of these device users, e.g. surveillance, law enforcement, SAR and military operations, significant variations to normal aircraft operating procedures may be encountered. Pilots should acquaint themselves of the activity by making use of pre-flight briefing facilities and when in flight take account of possible non-standard procedures.
- 14.2 Aircraft operating in close proximity to such traffic may request that external lighting be displayed. Night agricultural operators in areas known to be used for night vision device training (e.g. Oakey and Townsville) should advise defence authorities of their intentions.

15. HIGH ALTITUDE BALLOON FLIGHTS

- 15.1 Large helium-filled plastic balloons are launched periodically from various locations. They carry scientific equipment to record data from the upper atmosphere and normally ascend to altitudes in excess of 70,000 FT with flight duration of 80 hours or more. The main balloon launching station is at Alice Springs but other launching sites, e.g. Charleville, may also be used. Where possible, flight paths will be selected so that the recovery area is outside the more densely populated Eastern/South Eastern/South Western areas. Notification will be by NOTAM.

16. DESIGNATED REMOTE AREAS

Notes:

1. ACFT planned to operate within or through the designated remote area shown in this section are required to carry survival equipment suitable for sustaining life in the area over which the flight is planned as per the civil aviation legislation relevant to their operation.
2. Flight through corridors must be made within sight of and not more than five miles from the highway concerned.
3. Australian administered islands adjacent to the Remote Area between Anna Plains and Cairns are part of the Designated Remote Area.
4. Mainland within 50NM of Darwin excluded from Designated Remote Area.

17. UNMANNED AERIAL VEHICLE (UAV) TESTING

17.1 Introduction

- 17.1.1 Unmanned Aerial Vehicle operations including testing and development take place in various Danger Areas and military Restricted Areas.
- 17.1.2 Temporary Danger Areas may be promulgated for other UAV operations if CASA considers there is a risk to other flights such that pilots need to be warned of the danger in order to take appropriate precautions.

17.2 UAV Operations

- 17.2.1 UAVs may be flown autonomously within the designated areas, but are subject to operator input. The operator will maintain continuous two way communications on the appropriate aeronautical frequencies, make regular broadcasts advising location, altitude and intention of the UAV and will respond to calls.
 - 17.2.2 Pilots wishing to operate within a Danger Area designated for UAV activity are advised to contact the UAV ground station on the appropriate FIA/CTAF e.g. "UAV TRAFFIC - [location] AREA THIS IS...". While no response from the ground station would normally mean that no UAV is airborne, pilots are encouraged to maintain an enhanced lookout.

4. **AIR-TO-AIR COMMUNICATIONS - CIVIL**

- 4.1 Interpilot air-to-air communications in Australian FIRs may be conducted on frequency 123.45MHz. Aircraft engaged in flights over remote and oceanic areas, out of range of VHF ground stations, and not in the vicinity of a charted non-controlled aerodrome, should use this channel to exchange operational information. Communications between aircraft on this frequency are restricted to the exchange of information relating to aircraft operations. Communications are to be established by either a directed call to a specific aircraft or a general call, taking into account conditions pertaining to the use of the particular channel. As target aircraft may be guarding more than one frequency, the initial call should include the distinctive channel identification "INTERPILOT" or identification of the air-to-air frequency.
- 4.2 The following examples illustrate the application of the calling procedures.
 - a. Qantas 2, SPEEDBIRD 15, INTERPILOT, DO YOU READ?; or
 - b. ANY AIRCRAFT VICINITY 10S 135E, QANTAS 5, 123.45, OVER.

5. AIR TRAFFIC SERVICES DATALINK SERVICES**5.1 HF SELCAL Check**

- 5.1.1 For aircraft departing Australian airspace, a SELCAL check is not mandatory. However, flight crews wishing to satisfy themselves with HF performance should perform a SELCAL check after departure, but prior to being transferred to CPDLC. The primary HF frequency will be advised with the transfer instruction. The HF operator will confirm the primary and secondary HF frequencies on first contact.

- 1.5.2 **Indications by an Aircraft:**
- In Flight
 - during the hours of daylight - by rocking the aircraft's wings; and
Note: This signal should not be expected on the base and final legs of the approach.
 - during the hours of darkness - by flashing on and off twice the aircraft's landing lights or, if not so equipped, by switching on and off twice its navigation lights.
 - On the Ground
 - during the hours of daylight: by wagging the aircraft's ailerons or rudder; and
 - during the hours of darkness: by flashing on and off twice the aircraft's landing lights or, if not so equipped, by switching on and off twice its navigation lights.
- 1.5.3 **If VFR in Class G Airspace**
- Remain in VMC.
 - Broadcast Intentions (assume transmitter is operating and prefix calls with "TRANSMITTING BLIND").
 - Remain VFR in Class G airspace and land at the nearest suitable aerodrome.
 - Report arrival to ATS if on SARTIME or reporting schedules (SAR telephone number: 1800 815 257).
- 1.5.4 **If in Controlled/Restricted Airspace or if IFR in any Airspace:**
- Squawk 7600
 - Listen out on ATIS and/or voice modulated NAVAIDs.
 - Transmit intentions and make normal position reports (assume transmitter is operating and prefix calls with "TRANSMITTING BLIND").
- AND**
- if in VMC and are certain of maintaining VMC
- Stay in VMC and land at the most suitable aerodrome (note special procedures if proceeding to a Class D).
- OR**
- If in IMC or are uncertain of maintaining VMC
- If no clearance limit received and acknowledged, proceed in accordance with the latest ATC route clearance acknowledged and climb to planned level.

- f. If a clearance limit involving an altitude or route restriction has been received and acknowledged:
 - (i) maintain last assigned level, or minimum safe altitude if higher, for three (3) minutes, and/or
 - (ii) hold at nominated location for three (3) minutes, then
 - (iii) proceed in accordance with the latest ATC route clearance acknowledged, and climb to planned level.
- g. If receiving an ATS surveillance service:
 - (i) climb to MSA/LSALT, and,
 - (ii) if being vectored, maintain last assigned vector for two (2) minutes, then
 - (iii) proceed in accordance with the latest ATC route clearance acknowledged.
- h. If holding:
 - (i) fly one more complete holding pattern, then
 - (ii) proceed in accordance with the latest ATC route clearance acknowledged.

Notes:

1. *Initial and subsequent actions by the pilot at the time of loss of communications will depend largely on the pilot's knowledge of the destination instrument approaches, the air traffic/airspace situation and meteorological conditions en route and at the destination. Publishing procedures that cover all radio failure circumstances is not possible. The above procedures ensure that ATS and other traffic should be aware of the pilot's **most likely actions**. Pilots should follow these procedures unless strong reasons dictate otherwise.*
2. *In determining the final level to which a pilot will climb after radio failure, ATC will use the level provided on the flight notification, or the last level requested by the pilot and acknowledged by ATC.*

1.5.5 **Destination Procedures:**

- a. Track to the destination in accordance with flight plan (amended by the latest ATC clearance acknowledged, if applicable).
- b. Commence descent in accordance with standard operating procedures or flight plan.
- c. Descend to the initial approach altitude for the most suitable instrument approach in accordance with the published procedures.
- d. Carry out the approach to the prescribed minima.

Notes:

1. *The most suitable approach is normally the approach that facilitates the most accurate track keeping, however, if the pilot is in receipt of ATIS or directed information (e.g. voice modulated navigation aid) that a specific approach is required, that approach should be used.*
2. *If an approach time has been given by ATC and acknowledged, adhere to this time.*
3. *When within 25NM of the destination, the pilot may track direct to the IAF for the most suitable approach.*
4. *At Sydney during Independent Visual Approaches, refer to Sydney/Kingsford Smith entry in FAC section.*

1.5.6 **Actions at Minima**

- a. If visual at the minima at an uncontrolled aerodrome, continue to land provided that a safe landing can be accomplished. If visual at the minima at a controlled aerodrome continue to land provided that a clearance to land is received via a voice modulated NAVAID and/or light signal from the Tower.
- b. If not visual at the minima, depart for a suitable alternate aerodrome.
- c. If insufficient fuel is carried to divert to a suitable alternate, the pilot may hold or carry out additional approaches until visual.
- d. Certain Class D aerodromes have specific communications failure procedures which are shown at each aerodrome entry in the FAC section

LIGHT SIGNAL	Meaning to ACFT in Flight	Meaning to ACFT on Airfield
STEADY GREEN	Authorised to land if pilot satisfied no collision risk exists	Authorised to takeoff if pilot satisfied no collision risk exists
STEADY RED	Give way to other aircraft and continue circling	Stop
GREEN FLASHES	Return for landing	Authorised to taxi if pilot satisfied no collision risk exists
RED FLASHES	Airfield unsafe - do not land	Taxi clear of landing area in use
WHITE FLASHES	No significance	Return to starting point on airfield

1.6 Speechless Radar Approach Procedures

Situation	Transmission
1 Pilot request for Speechless Radar approach when microphone/s are unserviceable (carrier wave only available).	Pilot transmits four (4) separate and distinct unmodulated transmissions of one second duration
2 Pilot responses to subsequent control questions: A. affirmative or acknowledgment, B. negative, C. say again	A. one distinct transmission B. two separate and distinct transmissions C. three separate and distinct transmissions

4 Pilot indication of abandoning the aircraft	A single continuous transmission as long as practicable. Where possible the transmitter key is to be locked on.
5 Controller requires pilot to indicate when an instruction has been completed	WHEN (condition or instruction is completed) MAKE A TWO SECOND TRANSMISSION

1.6.1 Communication and NAVAID Failure

In the event of complete failure of communications and NAVAIDs, maintain terrain clearance and proceed as follows:

- a. If VFR in Class G Airspace
 - (i) Remain VMC.
 - (ii) Broadcast intentions (assume transmitter is operating and prefix calls with "TRANSMITTING BLIND").
 - (iii) Remain VFR in Class G airspace and land at the nearest suitable aerodrome.
 - (iv) Report arrival to ATS if on SARTIME or reporting schedules.
- b. If in Controlled / Restricted Airspace or if IFR in any Airspace:
 - (i) Squawk 7600.
 - (ii) Listen out on ATIS and/or voice modulated NAVAIDs.
 - (iii) Transmit intentions and normal position reports (assume transmitter is operating and prefix calls with "TRANSMITTING BLIND"). if practicable, leave/avoid controlled/restricted airspace and areas of dense traffic.
 - (iv) As soon as possible, establish visual navigation.
 - (v) Land at the most suitable aerodrome (note special procedures if proceeding to a Class D - see above).
 - (vi) Report arrival to ATS.

1.7 Emergency Change of Level in Controlled Airspace

1.7.1 When an aircraft in controlled airspace is required to make a rapid change of flight level or altitude because of technical trouble, severe weather conditions, or other reasons, the change will be made as follows using urgency message format, stating level changes involved and diversions, if applicable:

- a. Squawk SSR Code 7700.
- b. Transmit: PANPAN, PANPAN, PANPAN, then
 - (i) agency being called,
 - (ii) aircraft identification;
 - (iii) nature of urgency problem;
 - (iv) intention of person in command;
 - (v) present position, flight level or altitude and heading; and
 - (vi) any other useful information.

1.8 Pre/Post Impact Actions

1.8.1 The following actions should be carried out pre-impact:

- a. Activate Crew Impact Instruction. If no prescribed drill, check:
 - (i) preparation of aircraft for impact;
 - (ii) positioning of personnel;
 - (iii) activate ELT (see separate section following);
 - (iv) crew procedure for directing evacuation of aircraft in orderly manner; and
 - (v) ready availability to crew members of charts showing emergency and distress communication facilities; i.e. location, callsign, frequency of:
 - aeronautical stations;
 - DF stations; and
 - coast radio stations guarding international distress frequencies.
- b. Instruct passengers that they will be required to
 - (i) recognise the absolute authority of the pilot in command;
 - (ii) apply safety apparatus as instructed;
 - (iii) prepare for impact shock as instructed;
 - (iv) don protective clothing;
 - (v) make an orderly exit from the aircraft; and
 - (vi) remain near the aircraft after the evacuation (at sea, secure life rafts and set sea anchor).

1.8.2 Immediately prior to impact, set radio apparatus for continuous operation unless the additional risk of fire is too great.

1.8.3 The following should be carried out post-impact:

- a. Activate post impact instructions.
- b. If no prescribed drill, check the following:
 - (i) account for all personnel;
 - (ii) account for all distress facilities;
 - (iii) tend to the injured;
 - (iv) try to attract attention (radio, flares, smoke, mirrors, etc.);
 - (v) display appropriate visual rescue signals;
 - (vi) keep personnel together;
 - (vii) utilise passenger resources, i.e. skill, knowledge, effort, etc.;
 - (viii) delegate duties as equitably as possible;
 - (ix) conserve resources, i.e. water, food, manpower, facilities;
 - (x) maintain passenger morale; and
 - (xi) ensure ELT is activated.
 - (xii) collect all food/water and useful equipment from the aircraft.

1.9 Inadvertent Activation of Emergency Locator Transmitter (ELT)

1.9.1 If the ELT has inadvertently been activated for more than 10 secs contact SAR on 1800 815 257.

1.10 Activation of ELT

1.10.1 An Emergency Locator Transmitter (ELT) is a valuable search aid if an aircraft is forced down. However, to obtain maximum benefit from the beacon and to assist search aircraft, pilots need to observe a few guidelines for activation of the ELT.

- 1.10.2 If in water and the beacon is buoyant, the ELT should be activated in the water and allowed to float to the end of the lanyard with the aerial vertical. Do not hoist the ELT up a mast. The performance of an ELT may be degraded if it is raised above the water surface.
- 1.10.3 Lives may depend on the correct use of the ELT. The manufacturer's instructions should be studied thoroughly, and kept in the aircraft emergency kit.
- 1.10.4 If you are forced down the following procedure is recommended:
- Activate the ELT immediately;
 - Where the ELT is permanently installed in the aircraft, activate the beacon *in situ*;
 - Where the ELT is not permanently installed in the aircraft, select an elevated site clear of trees, boulders etc. and reasonably close to the aircraft.
 - Place the beacon on the ground on an earth mat. If an earth mat is not available, place the ELT on the wing of the aircraft or another metal reflective surface.
 - Secure the ELT with rocks, sticks, tape etc. so that the aerial will remain vertical. avoid anything touching the antennae as this will degrade ELT performance.
 - Remain clear of the ELT. Obstacles near the ELT will distort the radiation pattern.
 - An ELT which is damaged or under wreckage may still transmit some signal. (Always activate the ELT).
 - Do not switch off the ELT unless rescue is no longer required.
 - To avoid confusing COSPAS/SARSAT and direction finding equipment, avoid activating two or more ELTs within 1NM of each other.

Note: In many cases, using an earth mat will increase the effective range of a portable ELT by 50%. A simple and effective earth mat can be made by using household aluminium foil to make a 120CM square, folded, and taped to the unit. To use the earth mat, unfold and place it flat on the ground, securing edges with dirt or rocks. Activate the ELT and place it on the mat.

1.11 ELT Characteristics

1.11.1 The following characteristics pertain to ELTs:

- a. Frequency 406 MHz (digital) and 121.5 MHz (analog) and, in some instances, 243 MHz.
- b. 121.5 and 243MHz modulation.
 - (i) continuous carrier continuously modulated at the rate of three swept tones per second, no pauses;
 - (ii) some older marine beacons transmit the carrier on for one second then off for one second, modulation three swept tones per second. This results in the tones being received in evenly spaced groups of three with a distinct one-second pause between groups; and
 - (iii) some foreign marine beacons vary from the above; e.g. there is a European beacon pulsing in groups of two tones.

1.12 Reports

- a. report all beacons received;
- b. state characteristics;
- c. when giving signal heard/strength fade positions, include ACFT level and squelch disabled (MAX hash) information. This is necessary for plotting;
- d. advise if signal commenced/ended gradually or abruptly; and
- e. do not alter squelch setting unless requested.

Note: Rescue Co-ordination Centres can demonstrate the above signals on request.

2. AIR SEARCH PATTERNS

2.1 General

2.1.1 This section is included to assist pilots of aircraft engaged in air search operations. The information is necessarily brief and the SAR Centre recommends that a full preflight briefing be obtained whenever time and/or circumstances permit.

2.2 Visual Search

2.2.1 Visual search patterns are divided into six main groups, which are described briefly below. In the diagrams "S" represents track spacing, i.e, the distance in nautical miles between successive tracks flown by the search aircraft and will be specified by the RCC as part of the briefing or by the assessed visual range of the day.

a. **Trackline Search-** (See *DIAGRAM 1*)

- (i) A trackline pattern is most often used in an initial reaction.
- (ii) It is very suitable for use by an aircraft available at, or near, the time of a reported distress.
- (iii) The assumptions made are that survivors will be found on, or close to, the planned route of the missing craft, that the distressed craft is easily discernible, or that survivors will be capable of signalling should an aircraft be seen or heard.
- (iv) It provides a rapid and reasonably thorough coverage of a missing craft's planned route, and the immediately adjacent area.

SEARCH OBJECT'S TRACK LINE

SEARCH OBJECT'S TRACK LINE

DIAGRAM 1 - TRACKLINE PATTERN

b. **Parallel Track Search-** (See *DIAGRAM 2*)

- c. Search legs are aligned parallel to the major axis of the search area.

- d. The pattern is best used in rectangular or square areas.
- e. This pattern is very suitable for a search conducted over water.

DIAGRAM 2 - PARALLEL TRACK

f. **Creeping Line Search-** (See *DIAGRAM 3*)

- (i) The creeping line pattern differs from the parallel track pattern in that the search legs are parallel to the minor axis.

NOTE : WIDTH (W) = LEG (L) + SPACING (S)

DIAGRAM 3 - CREEPING LINE

DIAGRAM 4 - SQUARE SEARCH

- g. **Square Search-** (See *DIAGRAM 4*)
- (i) The aircraft is flown to make good the tracks shown in the diagram.
 - (ii) Turns may be to the left, or right, depending upon the observer positions.
 - (iii) The first two tracks are flown for a distance equal to "S", the third and fourth for a distance equal to twice "S", the fifth and sixth for $3 \times S$, and so on.
 - (iv) The final track to the start point should be the same as the initial search track.
 - (v) Observations should start at a distance of "S" before reaching the most probable position to avoid leaving an unscanned portion near the start point.
 - (vi) Observers should be briefed to pay particular attention to the scanning of the areas outwards of each turn to avoid leaving unscanned areas during the turns.
 - (vii) A square search should be planned so that, whenever possible, the approach to the most probable position (MPP), and the first leg, is made into wind.
- h. **Sector Search-** (See *DIAGRAM 5*)
- (i) This pattern is employed when the position of distress is known within close limits and the area to be searched is not extensive.
 - (ii) It is simple to execute and provides greater navigational accuracy than a square search.
 - (iii) The track spacing reduces towards the centre, resulting in a greater probability of detection in the area where the target is most likely to be located.
 - (iv) Radius of search, angular displacement and mean track spacing (MTS) are specified with the briefing.

DIAGRAM 5 - SECTOR SEARCH

- i. **Contour Search-** (See *DIAGRAM 6 AND DIAGRAM 7*)
- 2.2.2 This procedure requires an aircraft to be flown at selected contour levels, adjacent to the side of the mountain, starting at the highest selective level.

DIAGRAM 6 - CONTOUR SEARCH (PLAN VIEW)

DIAGRAM 7 - CONTOUR SEARCH

2.3 Electronic Search - (See DIAGRAM 8)

- 2.3.1 Electronic searching is used to search for survivors who may have activated a VHF (or VHF/UHF) locator transmitter. An aircraft equipped with a VHF receiver may locate a survival transmitter using procedures which are based on the assumption that an undistorted radiation pattern is approximately circular. A searchmeter may be used to assist a search operation and is basically a signal strength meter which can be plugged into an aircraft VHF receiver.
- 2.3.2 The following procedures should be used during initial aural search without a searchmeter:
- Set the aircraft receiver to its most sensitive condition-squelch disabled;
 - Note and report the position at which the signal is first heard (SH) and fades (SF) and do not change altitude or the condition of the radio;
 - After the signal has faded select a heading estimated to take the aircraft through the radiation pattern, but ignore any beacon signals received during the turn; and
 - Continue chording the radiation pattern until it is possible to establish a cocked hat for the probable position of the beacon, (See *Diagram 8*).
- 2.4 **Carry out a final homing (See DIAGRAM 9).**

DIAGRAM 9 - FINAL HOMING

- 2.4.1 The final homing procedures without a searchmeter are:
- Track towards the estimated centre of the radiation pattern.
 - Set the aircraft receiver to its most sensitive condition and descend, if possible, to be between 1000 and 2000 feet above ground level in the estimated centre. When the signal from the beacon is very strong and very clear, check on the adjacent frequencies of 121.45 or 121.55 MHz;
 - Traverse the area bounded by the cocked hat, listening for the beacon on the adjacent frequency;
 - On hearing the signal on the adjacent frequency, select and fly a heading which results in a stronger signal. As the signal increases in strength, check further off frequency and descend as required.
- At this stage it is most important that each track should be a straight line. Helicopter pilots should avoid any tendency to orbit a suspected site;*
- The accuracy of the homing will usually depend upon how far off frequency the signal can be heard. Observers will find that a signal being received on, for example, 121.3 or 121.7 MHz (over land) will rise to a sharp peak only as the search aircraft passes over the beacon site at 500FT above ground level. Where the terrain is heavily timbered (e.g. rain forest,), helicopter pilots should descend to lower levels and tune further off frequency to achieve greater accuracy. Information gained during straight and level flight only is most important and is the only data that should be used.*
- Where the signal is irregular, it is usually because the beacon is located amongst obstacles such as trees, rocks, wreckage, etc. The resultant radiation pattern is no longer circular and the signal heard/signal fade principles no longer apply.*
- 2.4.2 The following procedures should be used during aural search with a searchmeter:
- Set the aircraft receiver to its most sensitive condition-squelch disabled.
 - Plug the searchmeter into the SAR outlet.
 - Fly as high as practicable for aircraft type and weather conditions.
 - On receiving the emergency signal, advise the Rescue Co-ordination Centre (RCC) of position, heading and indicated airspeed.

- e. The radiation pattern from a beacon can either be approximately circular (regular) or lobular (distorted). Where the signal received from the beacon is constant the following procedures should be used:
- (i) Fly a heading which will result in an increase in the reading on the search meter. Maintain this heading at a constant altitude and airspeed (See *DIAGRAM 10*).

DIAGRAM 10 - SEARCHMETER PROCEDURES

- (ii) Note the time and aircraft position at each half division on the searchmeter.
- (iii) Continue (i) until readings on the searchmeter decrease. Select two positions of equal reading and return to the midposition.
- (iv) On arriving at the midposition turn 90DEG and note the readings on the search meter. If the meter readings decrease turn 180DEG and proceed to determine two further positions of equal signal strength then return to the mid-position.
- (v) When apparent that the beacon is close, descend, if possible, to an altitude giving approximately 2000FT clearance above terrain within approximately 10NM of the search aircraft.
- (vi) By continuing the boxing-in technique the observer should be able to estimate the position of the beacon to within an area of 24 square miles.
- (vii) The beacon site may be located with greater accuracy by detuning the VHF receiver to 121.45 or 121.4 whilst close to the beacon and noting the position on the ground over which there is maximum searchmeter deflection. The receiver may also be detuned to 121.55 or 121.6. With the search aircraft 500FT above ground level and the receiver tuned to 121.3 or 121.7, the signal will only be heard within 200-300 metres of the beacon site (See *DIAGRAM 11*).

DIAGRAM 11 - DETUNING PATTERN

INTENSITY OF STIPPLING INDICATES AMOUNT OF BACKGROUND HASH

DIAGRAM 12 - DISTORTED RADIATION PATTERN

Note: Where the signal from the beacon is broken and distorted, the most probable cause is that the beacon is amongst obstacles such as wreckage, trees, rocks, etc. which cause the signal to be absorbed or reflected, forming lobes.

With the search aircraft flying along the track indicated in Diagram 12, the searchmeter needle would rise and fall, corresponding with the passage of the aircraft through successive lobes where the signal could be heard. In between the lobes there would be receiver noise and no signal. Provided the aircraft is several thousand feet above terrain, the observer may assume that the signal is being received direct from the beacon rather than by reflection from surrounding terrain. Thus by following a lobe the search aircraft will be guided direct to the beacon, (See DIAGRAM 13).

DIAGRAM 13 - INTERCEPTING A LOBE

- f. When the ratio between the beacon signal and the background hash begins to favour the latter, alter heading until only a clear signal can be heard. The signal from the beacon should be continuous with clarity improving as the search aircraft approaches the beacon.
- g. Once a heading has been established, note the searchmeter readings. The readings will increase as the aircraft approaches the beacon site, reaching a maximum when about to overfly. The position of the beacon may be located with greater accuracy by progressively detuning the VHF receiver to 121.3 or 121.7MHz.

2.5 Overwater Searches

- 2.5.1 The principles of an overwater search using a searchmeter are similar to those used for a regular pattern. However, the following differences should be noted:
- The radiation pattern from a beacon transmitting overwater will generally be much larger than if the beacon were on land. This could be up to 90NM to an aircraft flying at 10000FT, and 180NM at 30000FT.
 - Some older marine beacons have an interrupted carrier.
 - Where a search aircraft is operating at an altitude of 10000FT or less and has a searchmeter reading of more than four, the pilot should check on the adjacent frequency of 121.45 or 121.55. If the signal can be heard on that frequency, albeit faintly, the search aircraft will be within 15 NM of the beacon.

2.6 Mountainous Terrain

- 2.6.1 A beacon which is activated in mountainous terrain may be likened to an electric light bulb illuminated in a model of the same area. The pilot of an aircraft flying in areas where the light is reflected would be able to receive signals which are reflected. From positions where the light could be seen direct, signals would be received directly from the beacon or, conversely, where there were no reflections and the light could not be seen, there would be no signals. Signals radiating from a beacon in rough country are absorbed, reflected and reinforced to form isolated patches of strong signal which tend to hinder rather than assist the location of the beacon.
- 2.6.2 To avoid possible confusion from reflected signals, it is essential that the search aircraft should conduct a homing from an altitude above all terrain in the general area. This does not apply to search aircraft flying in valleys or behind mountains in order to ascertain where the beacon signal cannot be heard.

3. SEARCH AND RESCUE SIGNALS

3.1 Third Party Emergency Reporting

- Remain in the vicinity or as directed otherwise and keep the aircraft, surface craft or distressed personnel in sight.
- Turn on automatic emergency radio equipment unless:
 - accurate position fixing is possible, and
 - two way communications exist with ATS.
- Report the following information as applicable to the responsible ATS:
 - TYPE** of aircraft or surface craft;
 - LOCATION** of distress incident in latitude and longitude, geographical point or bearing and distance from some fixed point; and
 - DETAILS** regarding the number of personnel concerned, whether known to be afloat and the apparent physical condition of survivors.
- Alert coast and ship stations by transmitting on international distress frequencies 2182, 4125, 6215 or 8291kHz.
- Transmit to any frequency which will enable other craft to home to the distress location.
- Call to surface craft to render assistance by use of manoeuvres set out below, or otherwise by communication on 2182, 4125kHz or 156.8MHz (VHF channel 16).
- Attempt to establish communication with the aircraft in distress when requested by ATC.
- Before departing from the area, turn off automatic emergency radio equipment.

3.2 Assistance of Surface Craft

3.2.1 To direct a surface craft to distress incident:

- circle the vessel at least once;
- fly across the bow of the vessel at low level while rocking the wings, opening and closing the throttles or changing propeller pitch if possible; and
- head in the direction required.

Note: Visual signals by the surface craft:

ACKNOWLEDGE - red and white vertical striped flag or flashing of a series of 'T's by light.
UNABLE TO COMPLY - square blue and white checkered flag signal or the flashing of a series of 'N's by light.

- 3.2.2 When assistance is no longer required fly across the stern of the vessel at low level, rocking the wings, opening and closing the throttles or changing propeller pitch if possible.
-

3.3 Emergency Management Australia (EMA)

- 3.3.1 During relief operations mounted in time of floods, bushfires or other disasters, ground/air signals may be used to indicate requirements.
- 3.3.2 Aircraft engaged by the relevant State Emergency Service to survey the area, will be briefed to watch for emergency signals. Pilots of other aircraft, not involved in the relief operation, should report sightings to the nearest ATS unit.
- 3.3.3 Pilots need to be aware of the importance of indicating the actual signal seen (e.g. Civil Emergency Signal No 3), as an attempt to interpret, the signal may be confusing to those receiving the message.

3.4 Ground/Air Emergency Signals in Use for Australian Civil Emergencies

GROUND - AIR VISUAL SIGNAL CODE FOR USE IN CIVIL EMERGENCIES		
No	Message	Code Signal
1	Require Fodder	FF
2	Require Evacuation	III

Notes:

1. Aldis lamp signals

Red flashes - not understood

Green flashes - message understood.

2. Air Ground Signals

The following signals by aircraft mean that the signals have been understood

a During the hours of daylight - rocking the aircraft's wings

b During the hours of darkness - by flashing the aircraft's landing or navigation lights on or off twice.

3. Lack of the above signal indicates that the message has not been understood.

4. The "GROUND - AIR VISUAL SIGNAL CODE FOR USE BY SURVIVORS" conforms to ICAO and NATO standards.

3.5 Visual Distress Signals - Small Vessels

Either of the two signals shown below may be displayed by small vessels. The signals are for use **ONLY** in the Australian Search and Rescue Area. The signal sheet is rectangular, coloured international orange, with black symbols.

4. SURVIVAL

4.1 Introduction

4.1.1 Alone and injured, people have survived in almost impossible circumstances. The determination to beat the situation and the will to survive is the survivor's strongest weapons. Military SAR will not give up searching for downed aircrew.

4.1.2 The peacetime priorities of survival are listed below:

a. **PROTECTION:** The elements of protection are:

- (i) First Aid - breathing must be restarted within 3 minutes;
- (ii) Clothing;
- (iii) Shelter - in harsh weather a shelter will be required in less than 3 hours; and
- (iv) Fire.

b. **LOCATION:** Most survivors are located within 3 days.

c. **WATER:** In Australia's arid centre water must be found within 3 days.

d. **FOOD:** Survival without food for at least 30 days is possible. Therefore, food is the lowest priority. Food information is contained in the JUNGLE SURVIVAL section.

4.1.3 Basic survival rules are outlined in the following sections:

- a. Location;
- b. First Aid;
- c. Desert Survival;
- d. Sea Survival;
- e. Jungle Survival; and
- f. Cold Weather Survival;

4.1.4 Rapidly adapt to the new situation - **DO NOT WASTE TIME**. Even if SAR is expected quickly develop a plan of action that will assist SAR and improve living conditions. Start working to beat the situation as soon as possible.

4.2 Location

4.2.1 Safety Equipment

4.2.2 When moving always carry location aids and protect them from deterioration. Do not fire pyrotechnics until SAR is sighted. Consider the best use of aids:

- a. survival radios/beacons,
- b. signal mirror,
- c. day/night flares,
- d. rockets,
- e. strobe,
- f. signal panels, and
- g. sea dye marker.

4.2.3 Improvised Aids.

a. Improve rescue chances by constructing fires and ground signals.

b. Signal Fires:

- (i) Initially use campfire
- (ii) 3 fires 30M apart in line or triangle.
- (iii) Burn greenery or wreckage to produce smoke during the day

4.2.4 Ground Signals.

Ground signals should be 1M wide and 6M long and must contrast with environment by using angles, colour, reflective material and shadow.

- Early CPR to buy time for defibrillation
- Early defibrillation to revert heart back to a normal rhythm
- Early advanced life support for drug administration and advanced airway management

4.3.4 **DRSABCD****Danger**

Ensure the area is safe for yourself, others and the patient.

Response

Check for response.

Send For Help

Dial Triple Zero (000) immediately.

Airway

Check and clear airway.

Breathing

Look, listen and feel for breathing.

CPR

30 compressions to 2 breaths at 100 compressions/min.

Defibrillation

If Automated External Defibrillator (AED) is available, follow voice prompts.

Monitor pulse, respirations and maintain ABC.

4.3.5 **Head Injury**

a. Lay with injured side down, if possible

b. Do not give drugs, water or food

4.3.6 **Stop Bleeding**

a. Apply direct pressure to wound with gloved hands / bandages;

b. If direct pressure insufficient, use a broad bandage to apply constrictive pressure at top of effected limb.

c. Do not remove embedded objects. Use a ring pad around protrusions.

d. Elevate the limb unless broken;

e. Tourniquets not used.

4.3.7 **Chest Injury**

a. Cover sucking chest wounds with a non porous bandage sealed on three sides (acts as one-way valve). If casualty becomes worse, remove the non-porous bandage;

b. Immobilise unstable chest by circumferential bandaging - firm not tight.

c. Posture casualty: Half-sitting with injured side down, if possible.

d. Do not give pain killers

4.3.8 **Wounds**

a. Use clean / sterile dressings

b. Do not remove embedded objects, use a ring pad around protrusions

c. Do not touch or replace internal organs. Cover with a sterile, wet pad (or gladwrap), do not apply pressure.

4.3.9 **Fractures:**

Support and Immobilise

a. Arms: Splint and strap to body;

b. Legs: Splint and strap together.

4.3.10 **Burns:**

Cool and Cover

a. Cool with water - 20 minutes

b. Do not remove material from wound

c. Cover with wet, sterile / non-stick dressing (or gladwrap)

4.3.11 **Shock:**

Casualty looks pale, skin feels cold and clammy

a. Lay conscious casualty on back, elevate legs

b. Maintain normal body temperature

c. Rest, reassure, no alcohol or drugs

4.3.12 **Minor Wounds**

Treat all minor wounds including scratches and cuts (prevent infection)

4.3.13 **Dehydration:**

Dark / pungent urine requires an increase in fluid intake

a. Rest in shade and cool

b. Drink fluids (water is best) - not alcohol / caffeine

4.4 **Acute Care**4.4.1 **Snakebite:**

a. Victim must remain calm. Use pressure Immobilisation Technique.

b. Firmly bandage whole limb. Start atop bite site then bandage limb upwards.

c. Bandage firm but not so tight as to cut off circulation.

d. Do not allow casualty to move - must remain still.

e. Splint the limb, immobilising as you would a fracture.

f. Monitor ABC / level of consciousness & circulation to effected limb.

-
- 4.4.2 Carbon Monoxide (CO) Poisoning:
- Remove casualty to fresh air - Casualties skin colour may sometimes look normal;
 - If available give concentrated oxygen;
 - Symptoms may include; headache, nausea, drowsiness, confusion;
 - CO is a colourless, odourless, tasteless gas.
- 4.5 **Desert Survival**
- 4.5.1 Immediate Action:
- Activate ELT immediately: and
 - Rest in solid shade 0.3M above ground. (Do not use aircraft interior, if no shade is available then erect a shelter)
- 4.5.2 **Desert Survival Rules:**
- Note: With temperatures above 30DEG C most of the body's water loss is through sweating. The body sweats to cool itself. Survivors must reduce body heat gains to minimise sweating and then procure water at night. Night temperatures may be cold.*
- Rest in shade 0.3M above or 75CM below ground. Avoid gaining heat from ground conduction or hot air layer above ground.
 - Do essential work when sun down and temperature has dropped to about 20DEG C;
 - Stay fully clothed. A single loose layer of clothing minimises heat gains and maximises sweat cooling;
 - Ration water to stay hydrated. Check colour of urine. Dehydrating will impair performance and does not decrease water consumption;
 - Eat only carbohydrates and only if water is available. Avoid greasy or fatty foods;
 - Do not travel unless sure of water. Walking in sun instead of resting in shade will at least halve survival time.
- 4.5.3 **Water Procurement:**
- Sterilise all water sources except plastic bag procurement methods. Instructions for setting up water procurement devices are contained with water transpirator bags.
- TRANSPIRATOR BAGS: Best water procurement device, set up immediately;
 - DESERT STILL: Set up at night;
 - DEW/RAIN;
 - PLANTS: Unreliable source, look for damp patches on trees and insect life; and
 - GROUND WATER: Some indicators are terrain, birdlife, vegetation, animal tracks and insects. Water may exist in rock pools in hills as well as underground, in low lying creek areas.
- 4.6 **Sea Survival**
- 4.6.1 Immediate Action:
- Secure and deploy raft.
 - Activate ELT immediately.
 - Gather useful equipment and board raft (dry if possible).
 - Roll call - locate missing persons.
 - Cut adrift, tie rafts together on 8M line and secure one man to raft.
 - Check raft, adjust sea anchor length to half distance between waves, and in cold weather inflate floor and canopy.
 - Retrieve, secure (to prevent loss if capsized) and inventory equipment.
 - Develop a plan of action.
 - Select a leader, allocate duties.
- 4.6.2 Allocation of Duties
- A fully loaded liferaft is cramped and uncomfortable.*
- Rotate duties.
 - Exercise, keep occupied and work as a team to minimise discomfort.
 - Allocation of duties should include, lookouts with location aids, raft maintenance, maintaining water devices and food procurement.
 - Plan pyrotechnic operations to avoid damaging raft.
- 4.6.3 Essential Rules For Sea Survival - If Short of Water.
- Ration water to stay hydrated. Check colour of urine, dehydration impairs performance and does not decrease water consumption. Hold reliable water sources in reserve;
 - In hot areas wear clothes dampened during day and remain in shade. This will halve water loss by minimising sweating. Protect eyes and skin against sun. Do not exit raft to swim;
-

- c. Fish should not be eaten if short of water, sun dry until rain provides sufficient water. Fish that have an unusual shape, features or skin instead of scales should not be eaten;
 - d. Avoid seasickness. Use seasick tablets, seasickness will wear off.
 - e. Do not drink seawater, urine or the blood of sea birds.
- 4.6.4 Keep Raft Dry,
Avoid immersion, foot and raft sores by regularly changing position.
- 4.6.5 Discourage Predators
- a. Do not trail attractive items.
 - b. Discard waste well away from raft at night.
- 4.6.6 Travel.
A small amount of control is possible by adjusting raft for wind or currents. Deploy sea anchor to travel with the current or retrieve it to travel with the wind.
- 4.7 **Jungle Survival**
- 4.7.1 Immediate Action
- a. Orientate and rendezvous with crew. (Stay fully clothed when moving in jungle);
 - b. If wreckage is hidden, move to nearby clearing to assist SAR.
 - c. activate ELT immediately.
- 4.7.2 Essential Rules For Jungle Survival:
- a. Protection - water and food will be readily available in the jungle but location by SAR will be difficult.
 - b. Set up location aids. Select sites to give location aids best possible ranges. Build fires with smoke to penetrate canopy (refer to "Improvised Aids in Location" section).
 - c. Sterilise water and animal food. Boil water for 5 minutes or use sterilising tablets. Discard animal food that shows any sign of disease. Always cook animal food to kill parasites.
 - d. If food is not recognised as safe, apply edibility test.
 - (i) Discard stinging plants, fungi, plants with milky sap or with the smell of almonds or peaches.
 - (ii) Discard food that irritates sensitive skin areas such as inside of elbow after 5 mins.
 - (iii) Chew a teaspoon quantity and spit out, discard if reaction occurs in 5 minutes.
 - (iv) Eat a teaspoon quantity and discard if reaction occurs in 4 hours and
 - (v) Eat two teaspoons quantities-plant is safe if no reaction occurs in 4 hours.
 - e. Do not travel unless habitation seen nearby or search scaled down. Travel rate can be as slow as 500M/HR. Creeks and ridgelines will give fastest travel. Leave messages at crashsite and camp and blaze trail if travelling.
- 4.7.3 Shelters
- a. A shelter will be required in rain or if overnighing.
 - b. Two taut separated layers of parachute or natural thatching at 60DEG will provide a waterproof shelter.
 - c. A single taut layer of parachute at 45DEG will provide a shower proof shelter.
 - d. Keep off the ground to avoid insects and parasites.
- 4.8 **Cold Weather Survival**
- 4.8.1 Immediate Action:
- a. Adjust clothing - protect hands and head.
 - b. Shelter from high winds. (Aircraft interior will provide windproof shelter but little thermal protection).
- 4.8.2 Essential Rules For Cold Weather Survival
- a. A drop in body core temperature will mentally effect the survivor, impairing work. The onset is difficult to detect and shivering should be taken as the first warning that heat losses must be minimised. Dressed only in flying clothing, survival chances are good, if a thermal windproof shelter is constructed quickly.
 - b. Keep clothing dry. Heat loss from wet clothing is 20 times greater than dry.
 - c. Remove clothing before commencing work to avoid sweating;
 - (i) Do not let snow melt on clothing;
 - (ii) Keep feet dry by preventing snow entering boots;
 - (iii) Loosen clothing to trap air.
 - (iv) Use a windproof layer to stop wind chill.
-

- d. Construct a shelter. If rescue is delayed then the windproof shelter used in the immediate action must be improved with insulation to provide thermal protection.
 - (i) 25CM of snow will provide good insulation.
 - (ii) Rafts, sound proofing or branches will provide insulation from ground.
 - (iii) A one man snow cave can be built in one hour.
 - (iv) In bad weather without a windbreaker an enclosed shelter is more useful than a fire.
- e. Maintain location aids.
 - (i) Keep battery powered equipment warm.
 - (ii) The insulation of a snow shelter will prevent survivors hearing SAR aircraft. Windproof ground signals should be constructed and kept free of snow.
- f. Do not travel unless habitation seen nearby or search scaled down. Travel is strenuous and as slow as 4KM/day. Crevasses and avalanches are hazards in ice and mountainous country.

4.8.3 Medical Hazards.

When outdoors, work in pairs. Observe partner to detect onset of cold injuries.

- a. Hypothermia. (Lowering of body core temperature). Hypothermia can occur in above zero temperatures. The symptoms are incoherence, slowing down, stumbling and weakness. These symptoms may be mistaken for fatigue. To treat hypothermia protect casualty from wind change wet clothing for dry and use body warmth and insulation to warm.
- b. Frostbite. The symptoms are tingling numbing sensation with waxy white appearance. Gently rewarm areas using body heat if nothing else is available. If deep frostbite has occurred leave frozen until rescued.
- c. Carbon Monoxide Poisoning. Ventilate shelters where a stove is used with two 6CM holes in door and roof. Do not light fires inside enclosed shelters.
- d. Snow Blindness. Prevent too much light entering eyes by using sunglasses or eyeshields. Keep eyes covered to recover from snow blindness.
- e. Dehydration. Cold will decrease thirst sensation. Check frequency and colour of urine to avoid unintentional dehydration. To maintain body core temperature drink warm water.

4.8.4 Shelters

The Lean-to with fire and reflector will provide good protection in wooded temperate conditions. An improvised igloo can be made by covering branches, rafts etc., with a parachute and covering with 25CM of snow, letting set and then removing the core. The A-Frame must be modified with 25 CM of snow cover to provide thermal protection. The quickest shelter to build without a shovel is the snow cave. Probe before building to check snow depth. Smooth walls to prevent dripping and construct a cold sump. Stay dry when digging. A snow trench may be constructed with a saw in hard snow.

5. **INTERCEPTION AND AIR DEFENCE IDENTIFICATION ZONE (ADIZ) PROCEDURES**

5.1. See *AIP ENR 1.12* for.

- a. the procedures and visual signals which apply over the territory and territorial waters of Australia in the event of interception of an ACFT, and
- b. the general rules and procedures used to identify air traffic entering any designated ADIZ under the control of Australia.
